About This Guide

Apttus CPQ on Salesforce Administrator Guide explains how to configure Apttus Configuration, Pricing, and Quoting (CPQ). This guide describes the administrative tasks to be performed to enable the features in CPQ and covers the most common use cases for Apttus CPQ administration.

Topic	Description
What's Covered	This guide walks the administrator through the process of CPQ administration. It provides conceptual information, step-by-step instructions, and use cases for CPQ administrative tasks. This guide describes the workflows for configuring products, defining the price for configured products, defining product and pricing rules and so on.
Primary Audience	Apttus Administrator
IT Environment	Refer to the latest <i>CPQ on Salesforce Release Notes</i> for information on System Requirements and Supported Platforms.
Updates	For a comprehensive list of updates to this guide for each release, see the What's New topic.
Other Resources	<ul style="list-style-type: none"> • <i>CPQ on Salesforce User Guide</i>: Refer to this guide for information on features and use cases of CPQ. • <i>CPQ on Salesforce Release Notes</i>: Refer to this document for information on system requirements and supported platforms, new features and enhancements, resolved issues, and known issues for a specific release.

This guide describes the following tasks:

- Create Products
- Manage Bundles
- Create Categories and Hierarchy
- Manage Attributes
- Manage Rules
- Create Price Lists
- Manage Pricing Rules
- Configure Quote/Proposal
- Manage Promotions
- Manage Assets and Asset Line Item

Before using CPQ, you must be familiar with the following:

- Basic Salesforce administration
- Salesforce and Apttus terms and definitions

If you are new to Apttus CPQ, begin here: [Get started](#) and [About Apttus Configure Price Quote](#).

What's New

The following table lists changes in the documentation to support each release.

Document	Topic	Description
Summer 2020 Rev D	Associating Options to a Bundle	Updated the description of the field Allow Cloning .
	Creating Option Groups	Updated the topic.
Summer 2020 Rev C	Configuring Option Net Adjustment Rollup to Bundle	New topic
	Configuring Renewal Settings	Added the "To synchronize renewal lines to renewal opportunities" section.
Summer 2020 Rev B	Configuring Lookup Field Settings	Added the following fields and description: <ul style="list-style-type: none"> • Lookup Record Limit • Junction Object Name • Junction Field Name • Junction Default Flag • Filter Criteria 2
	Creating Price List Items	Updated the description of the Price Type and Price Method fields.
	Adding Additional Details to a Price List Item	Updated the description of the Price Type and Price Method fields.
Summer 2020 Rev A	Enabling PDF Security for Generated Proposal Documents	Updated the code for Admin Entry in the topic.
	Configuring Installed Products Settings	Updated the description of the Asset Termination Fields setting with a warning.
	Configuring Custom Settings	Updated the description of Asset Termination Fields setting with a warning.
	Configuring Display Columns Settings	Updated the description of Display Type and Field Name settings.

Document	Topic	Description
Summer 2020	Configuring Custom Button to Access Configuration Page Directly	New topic. New feature.
	Configuring Display Columns Settings	Updated the topic with a note for the Display Type Asset Termination.
	Configuring Large Document Generation for Quote	New topic. New feature.
	Managing Constraint Rules	Updated the topic with information about support for <i>Show Messages</i> and <i>Prompt</i> in Match in Assets Match Conditions in CSCR. Updated the topic description.
	Configuring Custom Settings	<ul style="list-style-type: none"> • Added Update View Category Batch Size in Config System Properties. • Added the following settings in Proposal System Properties: <ul style="list-style-type: none"> • Large Doc Threshold • Large Doc Process Batch Size
	Managing Currency Conversion	New topic. New feature.
	Enabling Price Ramps	Updated the topic with information about ramps inheriting <i>Cumulative Range - Line Item</i> price matrices from the price list item.
	Enabling Auto Ramp Creation	Updated the topic description.
	Creating Custom Buttons for Different Flows	Updated the topic with information about the useAdvancedCurrency parameter.
	Defining the Criteria of a Promotion	Updated the description of the Value field.
	Configuring the Apply Promotion Window	New topic.
Configuring Display Actions Settings	Updated the topic with information about configuring action buttons on the Configuration page.	

Document	Topic	Description
	Creating Product Attribute Rules	Updated the topic with information about support for null value in scope.
	Pricing Extension Callback Class for Smart Cart	Updated the topic description.
	Creating Product Attribute Value Extensions	Updated the topic description.
	Enabling Quote Collaboration in the Org	Updated the topic with information about Field Det Settings for Quote Collaboration
	Running Maintenance Jobs	Updated the topic with information about Category and Bundle Maintenance.
	Managing Products	Updated the topic description.
	Creating Products	Removed information about Has Defaults .
	Managing Categories and Hierarchies	Updated the topic description. Updated the description of Offering and Option Group .
	Reordering Root Categories on the Catalog Page	Updated the topic description and added a note about editing layout.
	Running a Category Maintenance Job	Updated the topic description and moved the Category Maintenance section to Running Maintenance Jobs topic.
	Creating Option Groups	Updated the description of Offering and Option Group .
	Creating Price Lists	Updated the topic description.
	Associate a Price List with Categories	Updated the topic description.
	Adding Additional Details to a Price List Item	Updated the topic description.

Document	Topic	Description
	Applying the Default Pricing to Products	Updated the topic description.
	Creating Price Rulesets	Updated the topic description.
	Creating Price Rules	Updated the topic description.
	Creating Price Dimensions	Updated the topic description.
	Managing Contract Pricing	Updated the topic description.
	Defining Contracts to be Used in a Quote	Updated the topic description.
	Defining Multiple Contracts to be Used in a Quote	New topic.
	Configuring Contract Pricing through Price Agreements	New topic.
	Enabling Multiple Adjustments at the Line-Item Level	Updated the topic description.
	Managing Product Groups	Updated the topic description.
	About Search Filters (CPQ)	Updated the topic description.
	Configuring Search Filter (CPQ)	Updated the topic with a reference image.
	Managing Product Rules	Updated the topic description.
	Creating Constraint Rules	Updated the topic with information about Bundle Context .
	Creating Constraint Rule Conditions	Updated the topic description.

Document	Topic	Description
	Creating Constraint Rule Actions	Updated the topic description.
	Scenarios for Using Constraint Rules	Updated the topic description.
	Creating Product Attribute Values	Updated the topic description.
	Creating Attribute Value Matrices	Updated the topic description.
	Types of Promotions	Updated the topic description.
	Defining User Profiles and Permissions	Updated the topic description.
	Configuring Incentive Records	Updated the topic description.
	Creating Price Dimensions for a Promotion	Updated the topic description.
	Creating Child Filters	Updated the topic description.
	Configuring Data Rollups for Promotions	Updated the topic description.
	Defining the Scope of a Promotion	Updated the topic with information about including bundle with options in the Scope of promotions.
	Defining the Criteria of a Promotion	Updated the topic description.

	Generating Coupons for a Promotion	Updated the topic description.
	About Integration of Assets with Contracts	Updated the topic description.

Document	Topic	Description
	Configuring Auto Renewal of Assets	Updated the topic description.
	Renewing an Asset in Auto Renewal Mode	Updated the topic description.
	Renewing an Asset in OnDemand Renewal Mode	Updated the topic description.
	Using the Search Filter	Removed the topic.
	Configuring Conditional Inclusion of Options	Removed the topic.
Spring 2020 Rev A	Configuring Custom Settings	Updated the description of the Document Naming Convention setting under Proposal System Properties.
	Synchronizing Related Line Items with Opportunity Line Items	Updated the topic with a note that this feature is applicable only for Service CPQ.
Spring 2020	Configuring Installed Products Settings	Updated the description of the Editable Fields for Cancelled Lines, Asset Termination Fields, and Renewal Business Object Type settings. Added the Account Hierarchy Batch Size setting. Removed the <i>Change:MassEdit</i> option from the Submenu Actions setting.
	Creating Price List Items	Updated the note in the description of the Charge Type Criteria setting.
	Configuring Pricing Engine Settings	Updated the topic with information about turning on or of defer pricing at a flow level and selectively skipping the totaling of pricing of products on the Cart.

Document	Topic	Description
	Configuring Custom Settings	<p>Updated the topic with information about the following custom settings:</p> <ul style="list-style-type: none"> • Added the following custom setting: <ul style="list-style-type: none"> • Base Private Properties • Updated the Config System Properties > CSS Override setting description. • Added the following settings in Config System Properties: <ul style="list-style-type: none"> • Product Sorting Fields • Refine Search Checkbox Display Limit • Added a note for the Enable Price Matrix Audit Trail setting in Config System Properties. • Added the following settings in Proposal System Properties" <ul style="list-style-type: none"> • Document Naming Convention • Added the following field in Config Custom Classes: <ul style="list-style-type: none"> • Revalidation Callback Class • Added the Account Hierarchy Batch Size field in Installed Products Settings. Removed the Mass Edit Action Criteria Fields setting. Removed the <i>Change:MassEdit</i> option from the Submenu Actions setting. • Updated the description of the Editable Fields for Cancelled Lines and Renewal Business Object Type fields in Installed Products Settings.
	CPQ Package Objects	Added the object of the Apttus Base Library package.
	Installing the Apttus CPQ Packages	Updated the topic with information about the Apttus Base Library package.
	Upgrading Apttus CPQ	Updated the topic with information about upgrading from the previous two releases to the current release.
	Configuring Product Sort	New topic. New feature
	Creating Price Ruleset	Updated the topic with information about defining currency for the price ruleset.
	Creating Price Rule	Updated the topic with information about setting the UOM and effective dates for price rule entry.

Document	Topic	Description
	Creating Price Dimensions	Updated the topic with more information about Context Type and Type .
	Applying Miscellaneous Pricing to a Product	Updated the description of the Disable Asset Integration setting with a note.
	Managing CPQ Formula Fields	New topic. New feature
	Creating Constraint Rule Actions	Updated the description of the Match in Assets Match Conditions .
	Constraint Rules	Updated the topic. Added information about support for the Match in Assets Match Conditions in inclusion rules.
	Opportunity Renewal - OnDemand	Moved the section about Asset Renewal Callback Class to the new topic Asset Renewal Custom Callback Class .
	Creating Custom Buttons for Different Flows	Renamed the topic from "Creating a custom button for the new user interface". Updated the topic with information about the asyncFinalize parameter. Added the isCartTotalingDisabled , isCartApprovalDisabled , isPricingGuidanceDisabled , and &deferPricingUntilCart parameters.
	Visibility Rules through Custom Classes	Renamed the topic to Product Filter Callback Class and moved the new topic under Callbacks .
	Using Asset Line Item Callback Class	Renamed the topic to Asset Line Item Callback Class and moved the new topic under Callbacks .
	Callbacks	New topic. Added description for Callback Class
	Display Action Callback Class	Updated the description.
	Option Filter Callback	Updated the description.
	Asset Line Item Callback Class	Updated the topic description. Renamed this topic from "Using Asset Line Item Callback Class" to "Asset Line Item Callback Class".
	Asset Renewal Custom Callback Class	New topic.

Document	Topic	Description
	Product Attribute Callback Class	New topic.
	Related Pricing Callback Class	New topic.
	Validation Callback Class	New topic.
	Product Filter Callback Class	Updated the topic description. Renamed this topic from "Visibility Rules through Custom Classes" to "Product Filter Callback Class".
	Adjustment Line Item Callback	Updated the description.
	Pricing Callback Classes	Updated the description of the topic.
	Revalidation Callback Class	New topic. New feature.
	Promotions Management	Updated the definition and scope of Promotions Management.
	Defining the Benefits of a Promotion	Updated the topic with information about using operators to define multiple benefit products.
	Creating an Approvals Workflow for Promotions	Updated the topic with information about selectively skipping approval of the Cart.

	Client Side Constraint Rules	Removed the topic. The relevant information is mentioned with the appropriate topic.
	Constraint Rules	Updated the topic with information about Client-Side Constraint Rules
	Create Constraint Rules	Updated the topic with information about effects of deactivated or deleted constraint rules on the finalized cart.
	Constraint Rule Actions	Updated the topic. Modified description of Min/Max Match Rule .

Document	Topic	Description
	Setting up an Inclusion Rule	Updated the topic with information about Added By and Added By Rule Info fields.
	Setting up an Exclusion Rule	Updated the topic with information about Hide functionality.
Spring 2019 Rev A	System Properties	Added Enable Custom Rounding setting.
Spring 2019	Configuring Config Page Settings	Added Enable Option Page Search setting.
	Configuring Installed Products Settings	Updated the topic with information about Change:Split sub-menu action and Split Asset Action settings.
	Associating Options to Bundles	Updated the topic with information about the message displayed to run Bundle Maintenance batch job.
	Client Side Constraint Rules (CSCR)	Updated the topic with a note about support for Match in Location .
	Defining a Cost Model	Updated the topic with information about the Hide Child Cost Types in Price Waterfall option.
	Enabling Quote Collaboration in your org	Updated the topic with information about revoked requirement Modify All setting.
	Defining the Scope of a Promotion	Updated the topic with information about searching a product by its name or code.
	Data Flow	Updated the topic with information about using the Auto Renewal flag correctly.
	Manage Product Page	Added the topic with information about Manage Product page in CPQ Admin.
	Cloning Products	Added the topic with information about cloning product in CPQ Admin.
Winter 2018 Rev B	Applying and Removing Promotions or Coupons on Line Items in Cart	Moved this topic from this guide to <i>CPQ on Salesforce Winter 2018 User Guide</i> and merged content in the "Applying Promotions on the Products in the Shopping Cart" topic.

Document	Topic	Description
Winter 2018 Rev A	Config System Properties	The Config System Properties related to large cart were removed because the large cart feature was not part of the Winter 2018 release.
Winter 2018	Config System Properties	Added a new field. Enable Notification Feed
	Defining Split Criteria	New topic. New feature for this release.
	Multiple Adjustments at the Line Item	Updated the topic with details on Adjustment Types.
	Creating Constraint Rule Actions	Updated the topic with information about the value <i>Hide</i> in the Action Intent table.
	Client Side Constraint Rules (CSCR) Enhancements	Updated the topic with information that Match in Cart Options is now supported.
	Pricing Callback Classes	Updated the topic with the method onPriceltemSet() .
	Enabling Quote Collaboration in your org	New topic. New feature for this release.
	Defining Permissions for Favorite Feature	New topic. New feature for this release.
	Associating Options to Bundles	Updated the topic with a note in the topic about shared option groups.
	Structure Section	Updated the topic with a new feature for CPQ Admin.
	Lookup Field Setting	Updated the topic with information about the Filter Criteria 2 field.
	Installed Products Settings	Updated the topic with information about End Date Preference Coterminationand sub-menu actions.

Document	Topic	Description
	Applying and Removing Promotions or Coupons on Line Items in Cart	Updated the topic with information about applying promotions. (Moved this topic to <i>CPQ on Salesforce Winter 2018 User Guide</i> in Winter 2018 Rev B)
	Generating Coupons	Updated the topic with a note about generating coupons.
	Adding Custom Columns to the Mass Edit (Assets) Window	New topic. New feature for this release. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Removed the topic in Spring 2020 because it is an invalid feature.</p> </div>
Summer 2018 Rev A	Currency Field Precision	Information about the application of Currency Field Precision is added as a note.
	Expand Bundles in Cart	Information about Pagination feature is added as a note
Summer 2018	Creating a Price List	New configuration for creating a price list is added: Disable Based on Currency Adjustment
	Applying Miscellaneous Pricing to a Product	Disable Cost Model field is added.
	Creating Price List Items	New grouping type such as Summary Group is added.
	Adjustment Line Item Callback	Adjustment Line Item callback is added.
	Types of Promotions	Sales promotion details are added.
	Defining the Criteria of a Promotion	Contains operator is added.
	Use Case: Configuring a Promotion for the Total Price on the Cart	Usecase for an order level promotion is added.

Document	Topic	Description
	Managing Coupons	The Assigned To filter is added. Information about storage of coupon code is added as a note.
	Extending the Lead Time Functionality	Sample callback classes to extend the lead time functionality is added.

About Apttus Configure Price Quote

A quote or a proposal is a formal statement of promise that lists the products and services to be sold to a customer at a defined price. Quote creation involves configuring products and services, pricing them, and generating quotes based on predefined rules. Apttus Configure Price Quote (CPQ) is a sales tool for companies to generate quotes for orders quickly and accurately. CPQ produces accurate quotes making complex products, pricing, and business rules centralized, automatic, and available in real-time.

As an administrator, you can use Apttus CPQ to achieve Configuration, Pricing, and Quoting tasks involved in generating a quote. Configuration involves creating products, options, attributes, categories and associating them appropriately with each other for visibility on Catalog. A product can be created as a standalone product or as a bundle product with options and attributes. You can control the selection of a product on the catalog by configuring constraint rules. You can also control the selection of attributes on the configuration page of a product by setting up attribute-based configuration for that product.

Pricing enables you to set up pricing structures for the products so that the price for all products is calculated accurately. Pricing comprises of mainly two components: Price Lists and Price List Items. A price list controls the visibility of products to the user. A price list contains several price list items, each linked to a product. Apttus CPQ calculates the price for each product based on the applied price list, price list items, and various pricing and discounting rules. You can price any products or bundles based on their features or options selected. You can set up pricing rules, constraints, dependencies, and extraneous variables in Apttus CPQ to calculate the price for any product.

You can enable quote collaboration to allow a Sales Representative to get other users to contribute in configuration and pricing. The Collaborators can add or remove products and adjust pricing on the same configuration.

Apttus CPQ enables you to create templates for quote creation with details such as configuration and pricing details, a summary of the quote, and associated opportunity. In addition, by integrating CPQ with your contract processes, you can automate renewal quotes based on previously agreed upon pricing and terms.

Apttus CPQ allows to manage the assets of a customer with a variety of billing models to ensure efficient collections and accounting. You can define the asset management functions with different data objects to track quote and contract details until an order is fulfilled.

Apttus CPQ allows an administrator to perform the following administrative tasks:

- Manage products
 - Create, edit, clone, and delete standalone, bundle (including multi-level bundles), option products, option groups, and product groups
 - Create multi-level bundles
- Manage categories and category hierarchies
 - Create, edit, and delete categories and category hierarchies
- Manage attributes
 - Create, edit, and delete product attribute values
 - Create, edit, and delete product attribute groups
- Configure product visibility
 - Set up Refine You search
 - Configure Search Filter(CPQ)
 - Configure visibility rules
- Configure product comparison
 - Set up feature sets
- Configure constraint rules
 - Create, edit, clone, and delete constraint rules, constraint rule conditions, and constraint rule actions
- Attribute-based configuration
 - Create, edit, and delete attribute value matrices
 - Create, edit, and delete product attribute rules
 - Associate product attribute groups with products
- Manage pricing
 - Create, edit, clone, and delete price lists and price list items
 - Configure related pricing
 - Enable price ramps
 - Configure tiered pricing
 - Enable multiple adjustments at line items
 - Enable contract pricing
 - Configure price breakup
 - Configure cost and profitability
 - Set up unit of measure and conversion rate
 - Define currency rounding
- Manage price rule
 - Create price ruleset, price rule
 - Create price matrices
- Manage Cart
 - Configuring save as favorite
 - Enable quote collaboration
 - Cart locking for concurrent access

- Manage quote/proposal
 - PDF security for generated quote/proposal documents
 - Synchronize cart lines with quote
 - Set up quick quote mode
- Manage promotions
 - Configure coupons
 - Configure promotions
- Manage assets
 - Configure asset management flow
- Manage asset-based ordering
 - Configure asset-based ordering
 - Set up asset-based pricing
 - Configure installed product page
 - Set up opportunity-based renewals

Key Terminology

It is important to understand how terms are used when working with Apttus CPQ.

Term	Description
ABO	Asset-based ordering (ABO) functionality enables the customers to manage their existing subscriptions or install base using actions such as change, renew, swap, and terminate.
Administrators	Individual responsible for maintaining and mapping product catalogs and pricing.
Attribute-Based Pricing	The price is determined by factoring in attributes of a product.
Assets	Assets define a purchased product or service. An asset is associated with an account. After being processed and fulfilled, the line items associated with new quotes, agreements, or orders result in the creation of new assets, which can then be viewed or managed from the customer’s account.
Asset Pricing	A pricing method that allows you to leverage the sale price of an asset for its ongoing management.

Term	Description
Attributes	Features of a product, such as color, size, weight, and more.
Attribute Groups	A group that contains attributes that are shared by multiple products. For example, attributes of a computer are color, size, RAM and so on. These attributes are shared across different types of product such as a computer
Bundled Products	A combination of standalone products that offer added value to the customer while increasing overall sales.
Cart	A product and pricing view for the user to review all configuration and pricing information at a glance.
Catalog	A view that allows hierarchical categorization of products for users to search through and add to their configuration.
Categories	High-level logical groupings of products. Their grouping affects the way the end user sees them for selection in a product catalog. A category is created for browsing products in the selection pages, or they can be created to use options groups for a bundled product. Products are associated to a category through a category hierarchy. Category hierarchies are maintained using the Hierarchy Manager. They are also used to organize product prices into logical groupings.
Category Hierarchy	Products are associated to a category through a category hierarchy. Category hierarchies are maintained using the Hierarchy Manager
Clone	To replicate a field, record, template, etc.
Constraint Rules	Rules that drive automatic inclusion, exclusion, recommendation or replacement of products selected in the catalog page. Each Constraint Rule is composed of three parts: the Rule Detail, the Rule Condition, and the Rule Actions.
Contract Price List	A price list that helps the customer keep track of specific price agreements as applicable for that account.
Opportunity	A contact or an account that has a possibility or intent of business with you. An opportunity record is created when a new opportunity is created in the CRM. Sales representatives create quotes for an existing opportunity. Optionally, opportunities can also be created automatically as a part of the Apttus renewal automation process to provide visibility into the renewal pipeline.

Term	Description
Option Group	A group of product options that are associated with a bundled product.
Order	A confirmation document created by CPQ for a customer before delivering the goods or services.
Price Lists	Containers of items that are grouped in a price list. A price list controls which products are visible to the end user. A price list contains several price list items; each linked to a product. A product can be set up with one or more price list items.
Price Matrix (Matrices)	These are an advanced pricing concept used to define tiered pricing paradigms, or complex pricing structures with multiple criteria. Common examples are pricing tiers for a product based on user count or particular customer or transactional dimensions.
Price Ramps and Price Tiers	Pricing mechanisms that establish pricing that varies by time (ramp) or quantity (tiers).
Price Rule	Represents a single rule in a price ruleset.
Price Rule Sets	Price Rulesets are a mechanism to allow particular families, categories or groupings of products to have either line item pricing adjustments applied or summary pricing adjustments applied. Typical examples of these are volume discounting rules or promotional pricing rules.
Product	A product or service that can be sold on its own as a standalone item, an option of other products, or as part of a bundled product.
Product Attribute Group	Represents a product attribute group that contains attributes shared by products.
Product Attribute Value	Represents the attribute values for a product class. For example, color has attribute values such as red, green, blue, orange and so on.
Product Group	A logical grouping of one or more product records. This construct allows you to create combinations of products with similar characteristics/qualities for use in a Rule.

Term	Description
Quote or Proposal	A structured definition of a prospective sale that contains product configurations, pricing, and customer opportunity information.
Standalone Products	Refers to a device or software that is self-contained, one that does not require any other devices or software to function.
Service CPQ	A feature that caters to customer requirements related to services for existing or newly purchased products from Apttus. A sales rep associates a service product eligible for the equipment or an asset. The Eligibility rules, which are client-side constraint rules, play a vital role in guiding the association between a service product and an asset. A sales rep can set an existing asset as a service or equipment while the service pages (Installed Products, Catalog, Config, and Cart pages) leverage the end to end cycle for service management.

Getting Started with Apttus CPQ

Before You Install Apttus CPQ

This section explains the tasks to be completed before you install Apttus CPQ.

To enable Salesforce CRM content

Before you can install Apttus CPQ module packages, you must ensure that Salesforce CRM Content is enabled in your org. You must be logged into [Salesforce.com](https://salesforce.com).

1. Go to **Setup > Customize > Salesforce Files > Settings > Salesforce CRM Content** and click **Edit**.
2. Select the **Enable Salesforce CRM Content** check box.
3. Click **Save**. Salesforce CRM Content is enabled.

Now, you can start [installing the Apttus CPQ packages](#).

Installing the Apttus CPQ Packages

Multiple packages must be installed to implement the complete CPQ solution. Packages for CPQ must be installed in the order indicated in the table in this section. You begin with the Apttus base packages and then install the integration packages that enable the various products to function together.

You may not need to install all of the packages. For example, if your implementation does not use Apttus Advanced Approvals you do not need to install Apttus Approvals Management or Apttus Quote/Proposal Approvals Management. Refer to the table in this section to learn which packages are required for standalone CPQ and which packages are required only when you are using other Apttus products.

 Apttus recommends downloading and upgrading Apttus packages in a Salesforce sandbox **before** installing them in your production environment. For information on installing and upgrading in a sandbox, please contact Apttus Support before you install any packages.

Install the packages in the following order.

 The Apttus Base Library provides a shared library of reusable components that other Apttus packages may use. All CPQ and Contract Management customers must install this package in order to use Apttus CPQ and Contract Management products.

In addition, beginning in the Spring '20 release, Apttus is adding a User Experience Analysis component that collects product usage data. No action is required on your part and there is no impact to any existing product features, system functionality, or configured workflows. No personally identifiable information (PII), nor any other proprietary, confidential, or sensitive data will be collected. If, during installation, you see an "Approve Third-Party Access" prompt, please select the **Yes, grant access to these third-party web sites** check box and click **Continue**. For more information, see [CPQ on Salesforce Spring 2020 Release Notes](#).

Order	Package	Install Center tab to access the package	Required?	Install this package only if you also have...
1	Apttus Base Library	Contract Management	Y	
2	Apttus Contract Management	Contract Management	Y	
3	Apttus Proposal Management	CPQ	Y	
4	Apttus Configuration & Pricing	CPQ	Y	
5	Apttus Quote/ Proposal- Configuration Integration	Integrations	Y	
6	Apttus CPQ API	CPQ	Y	
7	Apttus Contract- Configuration Integration	Integrations	N	Contract Management
8	Apttus Quote/ Proposal-Contract Integration	Integrations	N	Contract Management

Order	Package	Install Center tab to access the package	Required?	Install this package only if you also have...
9	Apttus Quote/ Proposal-Asset Integration	Integrations	Y	Renewals
10	Apttus CPQ Admin	CPQ	Y	

If you are using Advanced Approvals for Quote, you must install the following packages:

Order	Package	Install Center tab to access the package	Required?
1	Apttus Approvals Management	Advanced Approvals	N
2	Apttus CPQ Approvals Management	Advanced Approvals	N
3	Apttus Quote/Proposal- Approvals Management	Advanced Approvals	N

You can additionally install the following packages if you are using the new Deal Maximizer

Order	Package	Install Center tab to access the package	Required?
1	Apttus Deal Maximizer Setup	Deal Maximizer	N
2	Apttus Deal Maximizer	Deal Maximizer	N
3	Apttus CPQ Maximizer	Deal Maximizer	N

 You must have Apttus-provided login credentials to the Apttus Community Portal to be able to download packages.

To install the CPQ managed packages

1. Go to the **Resources > Install Center** tab on the Apttus Community Portal.

2. In **My Packages** navigation link, click **CPQ**. From the **VERSION** drop-down, select the version that you want to install.
3. Click **Install Now**.
4. Select the environment in which you want to install the packages. Click **Install in Production** to install the packages in your production environment. Click **Install in Sandbox** to install the packages in your sandbox.
5. In the Salesforce login screen, enter your login credentials and click **Log In**.
6. On the Upgrade page, enter the password provided by Apttus.
7. Select the profile for which you want to install the package. Apttus recommends that you select **Install for All Users**.
8. If you want to **Install for Specific Profiles**, you must define the access level for all profiles. Select from one of the following options.
 - **No Access** - This is the default setting. Apply this access level to disable all object permissions.
 - **Full Access** - Apply this access level to assign users permissions to Read, Create, Edit, Delete, View All, and Modify All for all objects in the CPQ package.
 - **Pricing Administrator** - Apply this access level to assign users permissions to Read, Create, Edit, Delete, View All, and Modify All for all pricing-related objects in the CPQ package.

 If a permission is not enabled for a profile, you can apply Apttus-provided permission sets such as the **Apttus CPQ Admin** Permission Set and **Apttus CPQ User** Permission Set to enhance the access levels of the user profile. To assign a permission set, select it from the **Available Permission Sets** box and click **Add**. To remove a **permission set assignment**, select it from the **Enabled Permission Sets** box and click **Remove**. For more information, see the *Salesforce Administrator Guide*.

9. Click **Set**.
10. Click **Upgrade**.

A message is displayed indicating the installation is underway. Once installed, repeat this procedure for each of the packages.

Logging in to CPQ

Log in to your [Salesforce.com](https://www.salesforce.com) org to access Apttus CPQ.

 Do not use the Back button on your browser when using CPQ.

Before you log in to CPQ, make sure you meet the following criteria.

- You have installed all of the required CPQ module packages.
- You have administrative privileges.
- You have login credentials provided by Apttus.

To log in to CPQ

1. Go to <http://www.salesforce.com/>.

Or

If your organization is using a sandbox or test environment to access Apttus CPQ (for example, if you are doing user acceptance testing), go to <http://test.salesforce.com/> instead.

2. From the toolbar at the top of the page, click **Login**. The login page opens.
3. Enter your user name and password, and click **Log in**.
4. Navigate to **Apttus Product Setup** or **Apttus Pricing Setup** to access the Product or Pricing setup tabs, respectively.

- In Salesforce Classic: Click the App Menu ()
- In Salesforce Lightning Experience: Click the App Launcher ()

Now you are ready to start configuring your products and pricing in Apttus CPQ.

 For using Lightning Experience in your Salesforce org, you must enable My Domain in your organization. To know how to enable My Domain in your org, refer to the Salesforce Help page [My Domain](#).

Navigating the CPQ Admin User Interface

As an admin, you can use the CPQ Admin console to manage products and its related components such as options, attributes, and categories. The admin console helps you to create a product, associate the product with the categories, price lists, and price list items on a single page. You can define various settings in the Application Management section that are required to use Apttus CPQ.

 Alternatively, you can also use the classic Salesforce UI to create a product, associate the product with the categories, price lists, and price list items.

You can navigate to **Apttus CPQ Admin** app, and click **CPQ Admin** tab to access the admin console. The homepage of the Apttus CPQ Admin user interface consists of the **Products**, **Catalog**, and **Pricing** tabs on the primary toolbar and the **search** and the **filter** options on the secondary toolbar. You can configure the fields that are displayed on this page. For more information, see [Configuring the CPQ Admin Landing Page Fields](#) and [Configuring the Product Creation Screen Fields](#).

A description of each of these user interface elements is provided as follows:

- The **Products**, **Catalog**, and **Pricing** tabs enable you to add and manage products, product associations, and configure pricing. After you have selected any feature from the primary toolbar, you see a secondary toolbar that enables you to configure subsequent flows.
- The **Products** homepage consists of a list of products configured for the organization. The following tasks are available on the secondary toolbar.
 - Search filters enable you to define search criterion to search products. For more information about searching configured products, see [Configuring Product Visibility](#).
 - Click **New Product**. A product creation page is displayed. For more information about creating products, see [Creating Products](#).
 - From the menu icon () next to the **New Products** button, click **New from Clone** to create a new product by cloning an existing product configuration. For more information about cloning a product, see [Cloning Products](#).
 - You also search for the product on the homepage. See [Navigating the Product Page](#) for more information.
- The **Catalog** homepage consists of a list of categories.
 - Click field headers to sort the list on the Categories homepage to sort the column.
 - Enter the name of the product that you want to search in the search window. The category that matches the search is displayed.
 - Click **New Category** to navigate to the category creation page. For more information about creating categories, see [Creating Categories](#).
- The **Pricing** homepage consists a list of price lists.
 - Click field headers to sort the list on the Pricing homepage to sort the column.
 - Enter the name of the price list that you want to search in the search window. The price list that matches the search is displayed.
 - Click **New PriceList** to navigate to the price list creation page. For more information about creating price lists, see [Creating Price Lists](#).

- Click **Showing <number> Records** to select the number of products or category records that you want to display in the homepage. Click arrows < > to move to the next page.
- The **More** icon () on the primary toolbar enables you to execute maintenance jobs and configure various [Application Management](#) settings required to use Apttus CPQ.

Configuring the CPQ Admin Landing Page Fields

1. Navigate to **Setup > Customize > Products > Field Sets > Product List Fields**. This field set displays the fields on the landing page of CPQ Admin.
2. Click **Edit** for **Product List Fields**
3. Drag and drop the required fields in the **In the Field Set**.
4. Click **Save**.

Click **New Product** to create a new product configuration.

You can configure the fields that are displayed on the Product Creation page as well.

Configuring the Product Creation Screen Fields

1. Navigate to **Setup > Customize > Products > Field Sets > Product Detail Fields**. This field set displays the fields on the product creation screen of CPQ Admin.
2. Click **Edit** for **Product Detail Fields**.
3. Drag and drop the required fields in the **In the Field Set**.
4. Click **Save**.

When you click **New Product**, you land on the Product Creation screen.

Once you are done, you can click **Save Product**. Click **Cancel** to roll back the product creation and go back to the previous page.

There are multiple tabs for each product that you can use to associate the categories, create attributes, price list items, and more. As you navigate from one tab to the other, Apttus CPQ saves the data that you enter in the previous screen.

Profile Settings and Security

As an administrator, you can create or modify permissions for users to access the Apttus CPQ objects and its fields. Below is a representative list of access configuration for various user types.

CPQ Package Objects

Apttus CPQ is comprised of multiple packages as mentioned in the installation section and this page lists out the objects inside each package.

Apttus Base Library

Apttus Base Library package is used to contain reusable Lightning Web Components and Analytics related classes. The following table list the objects in Apttus Base Library.

Apttus Base Library Object	Purpose of the Object
Apttus UI Component Configuration	Object Records holds stored configurations for configurable higher-order components
Apttus UI Component Provider	The object records store the information about Providers of all types that are implemented by consuming applications
Configuration Action Provider (Deprecated)	Junction Object to Correlate Configurations to Action Provider(s)
Configuration Action Provider 2	Junction Object to Correlate Configurations to Action Provider(s)

Apttus Configuration and Pricing

Apttus CPQ Object	Purpose of the Object
Account Billing Summary	Represents the billing summary for an account.
Account Location	Represents a location for an account.
Adjustment Line Item	Represents an adjustment to the price of a product/service.
Agreement Price Rule	Represents a special pricing rule associated with an agreement or an asset.

Apttus CPQ Object	Purpose of the Object
Agreement Price Tier	Represents a single entry in an agreement price tier.
Application Feature	An object to contain features in the Applications, where Applications are Apttus products like CPQ, CLM etc.
Application Setting	Object to contain metadata about application settings.
Applied Expression Info	Represents expressions applied to the configuration.
Applied Rule Action Info	Rule actions that are applied to the configuration.
Applied Rule Info	Keeps track of rules applied to a configuration.
Asset Attribute Value	Represents the attribute values for a product class.
Asset Attribute Value History	Represents the attribute values for a product class.
Asset Line Item	Represents a product or service asset line item.
Asset Line Item History	Represents a product or service asset line item history.
Asset Transaction History	Represents a transaction that records the change to an asset.
Asset Usage Price Tier	Represents a single entry in an asset usage price tier.
Asset Usage Price Tier History	Represents a single entry in an asset usage price tier.
Attribute Group Translation	This object holds the translated values of attribute group object fields for all the languages.
Attribute Value Matrix	Represents the information about attribute value compatibilities or incompatibilities.
Attribute Value Matrix Entry	Represents a row (entry) in an attribute value matrix.
Batch Job (CPQ)	Represents an individual batch job.
Batch Job (CPQ) Parameter	Represents a batch job bind parameter.
Billing Plan	Represents a billing plan associated with a product or service that is part of a quote or order.
Billing Plan Item	Represents a billing entry in a billing plan of a quote or order.
Billing Plan Template	Represents the template to create a billing plan for a quote or order.

Apttus CPQ Object	Purpose of the Object
Billing Plan Template Item	Represents a billing plan template item associated with the quote or order.
Billing Preference	Represents a functional preference for billing purposes of a quote or order
Bundle Component View	Keeps the list references of component products related to the bundle and sub-bundle.
Cart Clone Info	
Category	Represents a category.
Category Hierarchy	Represents a category hierarchy.
CategoryTranslation	Catalog Hierarchy field translations are stored in this object. Each Category Translation object holds a translation for a SFDC supported language for a defined Category Hierarchy Object record.
Charge Group	Represents a group of charge types associated with a product or service.
Charge Group Member	Represents the mapping between a charge group and the charge types associated with the group.
Charge Type	Represents a type of charge for a product or service.
Collaboration Request	This object will persist information for quote collaboration tasks and will be used to relate the parent configurations and its related child configurations.
Constraint Rule	Captures information about configuration constraint rule.
Constraint Rule Action	Captures information about rule actions. Rule actions are applied only when the rule conditions are satisfied.
Constraint Rule Action Expression	
Constraint Rule Condition	Captures information about the condition of a constraint rule. In order for a rule to trigger all or some of the rule conditions should be true and the combining expression should be true.

Apttus CPQ Object	Purpose of the Object
Cost Adjustment	Represents an adjustment to the cost of a product/ service.
Cost Item	Represents a product entry in a Cost Model.
Cost Line Item	Represents cost associated with base price of line item.
Cost Model	Cost Model represents cost model of a FES or Factory.
Cost Type	Represents cost hierarchy definition.
Custom Message	Used to provide translation for messages used in custom objects.
External Order Adjustment Item	Represents an adjustment to the price of a product/ service.
External Order Summary	Represents an external order summary associated with an account.
External Order Summary Item	Represents a product or service line item associated with an external order summary.
Favorite Configuration	
Feature	Represents a single feature in a feature set.
Feature Set	Represents a set of features shared by products.
Field Expression	Represents a field expression.
Footnote	Represents a single footnote in a document.
Formula Field (CPQ)	Represents a formula field used in price dimensions and rules.
Frequency Conversion Rate	Represents the conversion rates used to convert pricing from one frequency to another.
G/L Account Map Entry	Represents a single entry in a G/L account map rule.
G/L Account Map Rule	Represents a G/L account map rule to determine G/L account numbers for a product or service.
Guided Question	Represents a question in a guided interview.
Guided Search Rule Entry	Represents a single entry in a guided search rule.

Apttus CPQ Object	Purpose of the Object
Guided Search Rule Filter	Represents a single search filter in a guided search rule entry.
Guided Selling Rule	Represents a rule to search for products based on a guided interview.
Help Doc	Object holds help documentation.
Incentive	Represents an incentive associated with one or more products.
Incentive Adjustment Item	Represents an adjustment to the price of a product/service.
Incentive Benefit Data	Represents a single benefit data row associated with the incentive benefit.
Incentive Coupon	Represents a coupon associated with an incentive.
Incentive Group	Represents a group of incentives.
Incentive Limit	Represents a single limit associated with an incentive.
Incentive Limit Data	Represents a single limit data row associated with the incentive limit.
Incentive Loyalty Enrollment	Represents a single customer enrollment into an incentive loyalty program.
Line Item	Represents a product or service line item.
Line Item Rollup	Holds rollup summary custom fields.
Loyalty Point Accrual Adjustment Item	Represents loyalty points accrual adjustments for a product/service.
Loyalty Point Accrual Summary	Represents a summary of loyalty points accrued for the account or contact.
Milestone	Represents milestones associated with other business objects.
Milestone Adjustment Item	Represents an adjustment to the price of a product/service.
Milestone Template	Represents a template for creating milestones.

Apttus CPQ Object	Purpose of the Object
Notification Feed	A generic object to contain Notification Feeds generated by any object for any page.
Order	Represents an order associated with an account.
Order Adjustment Line Item	Represents an adjustment to the price of a product/service.
Order Fulfillment	Represents an order fulfillment associated with an account.
Order Fulfillment Line Item	Represents a fulfillment line item associated with one or more orders.
Order Incentive Benefit Data	Represents a single benefit data row associated with the incentive benefit for the order.
Order Incentive Limit Data	Represents a single limit data row associated with the incentive limit for the order.
Order Line Item	Represents a product or service line item associated with an order.
Order Loyalty Point Accrual Item	Represents loyalty points accrued for a product/service.
Order Pocket Adjustment Line Item	Represents a pocket price adjustment to the price of a product/service.
Order Product Attribute Value	Represents the attribute values for a product class in an order line item.
Order Rollup Data	Represents the dynamic rollup data for use in criteria.
Order Tax Breakup	Represents the tax breakup of a product/service
Order Usage Price Tier	Represents a single entry in an order usage price tier.
Payment Term	Represents a payment term associated with a quote, order or an agreement.
Permission Set Relationship	
Price Breakup	Represents the price breakup of a product/service.
Price Dimension	Represents a price criteria dimension.

Apttus CPQ Object	Purpose of the Object
Price List	Represents a price list that contains the list of products the organization sells.
Price List Category	Represents the categories associated with a price list.
Price List Item	Represents a product entry in a price list.
Price Matrix	Represents a price matrix associated with a price list entry.
Price Matrix Entry	Represents a single entry in a price matrix.
Price Rule	Represents a single rule in a price ruleset.
Price Rule Entry	Represents a single entry in a price rule.
Price Ruleset	Represents a rule set that contains the list of rules to modify prices of products the organization sells.
Product Attribute	Represents a single attribute in a product attribute group.
Product Attribute Group	Represents a product attribute group that contains attributes shared by products.
Product Attribute Group Member	Represents the association between a product and an attribute group.
Product Attribute Matrix View	Represents a denormalized (materialized) view of product attribute and matrices.
Product Attribute Rule	Represents the rule definition of a product attribute value.
Product Attribute Rule Action	Represents a single action in a product attribute rule.
Product Attribute Rule View	Represents a denormalized (materialized) view of product and attribute rule.
Product Attribute Value	Represents the attribute values for a product class.
Product Classification	Represents a product classification which is a member of the list of products associated with a classification.
Product Configuration	Represents a product configuration.

Apttus CPQ Object	Purpose of the Object
Product Constraint	Represents a set of constraints a product must satisfy before it can be added to the product configuration.
Product Constraint Entry	Represents a single entry in a product constraint.
Product Constraint View	Creates product and constraint rule view table based on the definition of product scope in constraint rule condition.
Product Default Rule	Represents a rule to default products, quantity, and term.
Product Default Rule Filter	Represents a single filter in a product default rule.
Product Default Value	Represents the default values for a product.
Product Feature	Represents the association between a product and a feature set.
Product Feature Value	Represents the feature values for a product and its associated feature set.
Product Filter View	Represents the filter values for each product in a category.
Product Footnote	Represents the footnote available in a product or option.
Product Group	Represents a group of products.
Product Group Member	Represents a single product in a product group.
Product Hierarchy View	Represents a denormalized (materialized) view of product and classification hierarchies.
Product Information	Represents information associated with a product or a classification.
Product Option Component	Represents a product option component which is a member of the list of options associated with a product option group.
Product Option Group	Represents a product option group which is a member of the list of option groups associated with a product.
Product Option Price	Represents the price for an option or component.

Apttus CPQ Object	Purpose of the Object
Product Translation	This object holds the translated values of product object fields for all the languages.
Published Favorite	A junction object between Favorite Configurations and Price Lists to support many to many relationships.
Related Account Location	Holds the relationships between account locations.
Related Asset Line Item	Holds the relationships between asset line items.
Related Incentive	Holds the relationships between incentives.
Related Price List Item	Holds the relationships between price list items.
Related Product	Related products are for up-sell, cross-sell or related products (search helper).
Revenue Recognition Policy	Represents a revenue recognition policy associated with a product or service.
Revenue Split Policy	Represents an order revenue split policy associated with a product or service.
Revenue Split Policy Entry	Represents a single entry in a revenue split policy.
Rollup Data	Represents the rollup data for use in criteria.
Saved Search	Represents a saved search criteria.
Search Attribute Value	Holds product search parameters and default values for line items.
Search Filter (CPQ)	Represents a search filter.
Service Location	Represents a service location.
Setting Group	Object to group settings into logical sets.
Smart Search Activity History	Contains a history of the actions occurring during the search process when connecting to the Azure system (activation, deactivation, sync).
Summary Group	Represents a summary of line items.
Tax Breakup	Represents the tax breakup of a product/service.

Apttus CPQ Object	Purpose of the Object
Tax Certificate	Represents a tax certificate.
Tax Code	Represents a tax code associated with a product or service.
Temp Display Column	Holds information about columns displayed in the cart view.
Temp Filter	Helps in the binding of search filter values.
Temp Incentive Benefit Data	Represents a single benefit data row associated with the incentive benefit for the product configuration.
Temp Incentive Limit Data	Represents a single limit data row associated with the incentive limit for the product configuration.
Temp Object (CPQ)	A container for temporary objects used by the application.
Temp Renew	Temporary object for capturing user input to create asset line item during the amendment/renewal process.
Temp Renew Asset Group	Temporary object to store renew asset group processed by RenewOpportunityJob.
Temp Renew Asset Line Item	Temporary object to store renew asset line item processed by RenewOpportunityJob.
Temp Rollup Data	Represents the dynamic rollup data for use in criteria.
Totaling Group	Represents a totaling group.
Transfer Price	Represents association of source price like factory price with source cost like FES source cost.
Usage Price Tier	Represents a single entry in a usage price tier.

Apttus Contract Management

Apttus CLM Object	Purpose of the Object
Account Hierarchy	This defines a single instance of an account hierarchy relationship. It contains the leaf Id, the parent Id, the root Id, and the level.
Admin	Store admin preferences and metadata.

Apttus CLM Object	Purpose of the Object
Agreement	Represents an agreement in the system.
Agreement Action Condition	Represents conditions to enable agreement actions.
Agreement Clause	Represents a clause associated with an agreement.
Agreement Document	Links to agreement documents that are not stored in Apttus / Salesforce repository. These could be URLs to files stored on a file server or document management system behind the client's firewall.
Agreement Document Output Format	Holds default output format preferences by user profile and agreement type for use in the agreement document generation process.
Agreement Explorer	A reusable, unique combination of Field Sets and Filter Sets.
Agreement Hierarchy	This defines a single instance of an agreement hierarchy relationship. It contains the leaf Id, the parent Id, the root Id, and the level.
Agreement Line Item	Represents a product or service line item associated with an agreement.
Agreement Lock	Represents a lock on the agreement.
Agreement Protection	Specifies protection settings for agreements generated by the Apttus Contract Wizard and maintained by the Apttus Contract Author.
Agreement Rule	Specifies a rule used to evaluate various agreement actions such as submit request.
Agreement Rule Condition	Specifies a condition used to evaluate an agreement rule.
Agreement Term Exception	Term Exceptions associated with a given Agreement.
Async Merge Call	Holds asynchronous merge calls.
Content Event	Holds content events for subscribers to handle.
Cycle Time Field	Holds the fields monitored for cycle time data capture.
Cycle Time Field Data	Holds the data captured on fields for cycle time reporting.
Cycle Time Group	Holds the groups monitored for cycle time data capture.

Apttus CLM Object	Purpose of the Object
Cycle Time Group Data	Holds the data captured on groups for cycle time reporting.
Doc Assembly Component	Represents a single component in a document assembly rule.
Doc Assembly Rule	Represents a single rule in a document assembly ruleset.
Doc Assembly Ruleset	Represents a rule set that contains a list of rules to determine the sections to include in a dynamic template.
Document Agreement Clause	Agreement clauses in an agreement document.
Document Version	Represents a document version.
Document Version Detail	Holds the version details of a document.
Formula Field (Comply)	Represents a formula field used in agreement rules.
Merge Event	Holds document merge events for subscribers to handle.
Merge Event Detail	Holds document merge event details.
Query Template	Query Template for building SOQL queries and filters.
Query Template Filter	Filter expression used in a query.
Query Template Qualifier	Filter used to select a query template.
Related Agreement	To identify the different types of relationships between agreements.
Retention Policy	Holds object retention policies.
Search Filter (Comply)	Represents a search filter.
Temp Object (Comply)	A container for temporary objects and attachments.
Template	Contract language templates available in the system. These templates specify guidance, language, local settings, and include Word attachment templates representing the bulk of actual contracts that can be used when creating the first draft. Templates can include standard and non-standard language.
Template Clause Reference	Represents a clause reference in a template or a library.
Template Clause Reference Version	Holds Template Clause References for this version.

Apttus CLM Object	Purpose of the Object
Template Datasource Filter	Represents a data source filter associated with a template.
Template Dynamic Section	Represents a dynamic section in a template.
Template Dynamic Section Version	Holds the template dynamic section details for a given template version.
Template Version	Holds various versions of this template and is a Master-detail to Template.
Term Exception	Term Exceptions master table.
Wizard	A runtime instance of the wizard design.
Wizard Design	Holds all the wizard design records.
Wizard Input Control	The individual question, instruction statements, and associated field attributes.
Wizard Rule	Individual rules which are applied within a ruleset.
Wizard Ruleset	A collection of rules that are applied to input control and steps. The system determines a ruleset at the level of input control expression formula, determine focus objects, record type, and step navigation rules.
Wizard Runtime Input	Input Control instance within a runtime wizard.
Wizard Step	The step that is designed and used in Wizard designs.

Apttus Proposal Management

Apttus Proposal Management Object	Purpose of the Object
Document Collate Info	
Proposal Document Output Format	Holds default output format preferences by user profile and quote/proposal type for use in the quote/proposal document generation process.
Proposal Line Item	Represents a product or service line item associated with a quote/proposal
Proposal Request	Approval requests for a proposal

Apttus Proposal Management Object	Purpose of the Object
Quote/Proposal	Quote/Proposal object which holds dates and line items, many quotes/proposals may be related to a single opportunity, a quote/proposal may have many detail lines

Apttus Quote/Proposal-Configuration Integration

Apttus Quote/Proposal-Configuration Integration Object	Purpose of the Object
Proposal Adjustment Line Item	Represents an adjustment to the price of a product/ service.
Proposal Footnote	Represents the footnote available in a quote/ proposal.
Proposal Incentive Benefit Data	Represents a single benefit data row associated with the incentive benefit for the quote/proposal.
Proposal Incentive Limit Data	Represents a single limit data row associated with the incentive limit for the quote/proposal.
Proposal Location	Represents the location available in a quote/ proposal.
Proposal Product Attribute Value	Represents the attribute values for a product class in a proposal line item.
Proposal Rollup Data	Represents the dynamic rollup data for use in criteria.
Proposal Summary	Represents the summary of a product or service line item in a proposal.
Proposal Summary Group	Represents a summary of line items associated with a quote or proposal.
Proposal Tax Breakup	Represents the tax breakup of a product/service.
Proposal Usage Price Tier	Represents a single entry in a quote/proposal usage price tier.

Apttus Contract-Configuration Integration

Apttus Contract-Configuration Integration Object	Purpose of the Object
Agreement Adjustment Line Item	Represents an adjustment to the price of a product/service.
Agreement Footnote	Represents the footnote available in an agreement.
Agreement Incentive Benefit Data	Represents a single benefit data row associated with the incentive benefit for the agreement.
Agreement Incentive Limit Data	Represents a single limit data row associated with the incentive limit for the agreement.
Agreement Product Attribute Value	Represents the attribute values for a product class in an agreement line item.
Agreement Rollup Data	Represents the dynamic rollup data for use in criteria.
Agreement Summary	Represents the summary of a product or service line item in an agreement.
Agreement Summary Group	Represents a summary of line items associated with an agreement.
Agreement Tax Breakup	Represents the tax breakup of a product/service.
Agreement Usage Price Tier	Represents a single entry in an agreement usage price tier.

Configuring Post-Installation Settings

Post-installation settings are part of your specific business requirements which means your CPQ implementation will work with out-of-the-box installation, but you can customize the application per your specific implementation using custom settings.

Basic Post-Installation Configuration

These settings are mandatory settings in order for CPQ app to run

Configuring Proposal System:

1. Go to **Setup > Custom Setting > Proposal System Properties > Manage > New**
2. Refer to the following image and enter the values in the System property fields. (The values may vary according to your CPQ instance.)
3. Click **Save**.

The screenshot shows the configuration page for a Custom Setting named 'System Properties'. The fields and their values are as follows:

- Name: System Properties
- Admin User: [Empty]
- Bypass Sharing:
- CSS Override: [Empty]
- Custom Doc Gen URL: [Empty]
- Default Template Name: [Empty]
- Default Opportunity Quote Owner: Opportunity Owner
- Default Quote Agreement Owner: Quote Owner
- Disable Opportunity Products Copy:
- Email Template For Presenting Proposals: [Empty]
- Enable Fast Doc Gen:
- Enable PDF Security:
- Instance Uri: https://ap5.salesforce.com
- Max Child Level: [Empty]
- Merge Call Timeout Millis: 60,000
- Merge Webservice Endpoint: https://mergeweb.apttus.net/cgi-bin/4.2.1.2/MergeServer/Bin/MMCGI.exe
- PDF Owner Password: [Empty]
- Auto Create Cart Version After Finalize:
- Auto Create Order:
- Auto Sync With Opportunity:
- Clone With Approval Status:
- Enable Proposal Summary:
- Sync Bundle Using Line Items:
- Sync Option Products:

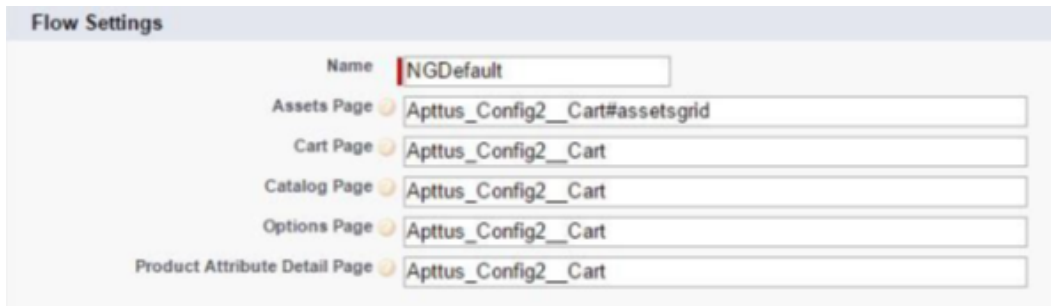

Configuring System Properties:

1. Go to **All tabs > Config Setting > System Properties**
2. Enter values in the fields.
3. Click **Save**.

Configuring Flow:

1. Go to **All tabs > Config Setting > Flow Settings**
2. Enter the values in the fields. Refer to the image below for an example.

3. Click **Save**.

Configuring Custom Settings:

1. Go to **Setup > Develop > Custom Setting > Config Select Products Settings > Manage**.
2. Find *Primary Settings*, Click **Edit**.
3. Enter a value in **Carousel Default Icon ID** (If you don't have any: create any notes & attachment, and get ID of that and enter here)
4. Click **Save**.

Advance Post-Installation Configuration

- To customize the CPQ application, use the System Properties.
- To customize the product selection page, use the Catalog Page Settings.
- To customize the option selection pages, use the Bundle Page Settings.
- To customize the Installed Products page, use the Installed Products Settings.
- To customize Apttus Quote/Proposal, use the Proposal System Properties.
- To customize Comply, use the Comply System Properties.
- To support product and proposal summary in Salesforce Lightning, use the Object Summary Settings.

Configuring Application Management Settings

This section describes how you can configure Application Management settings.

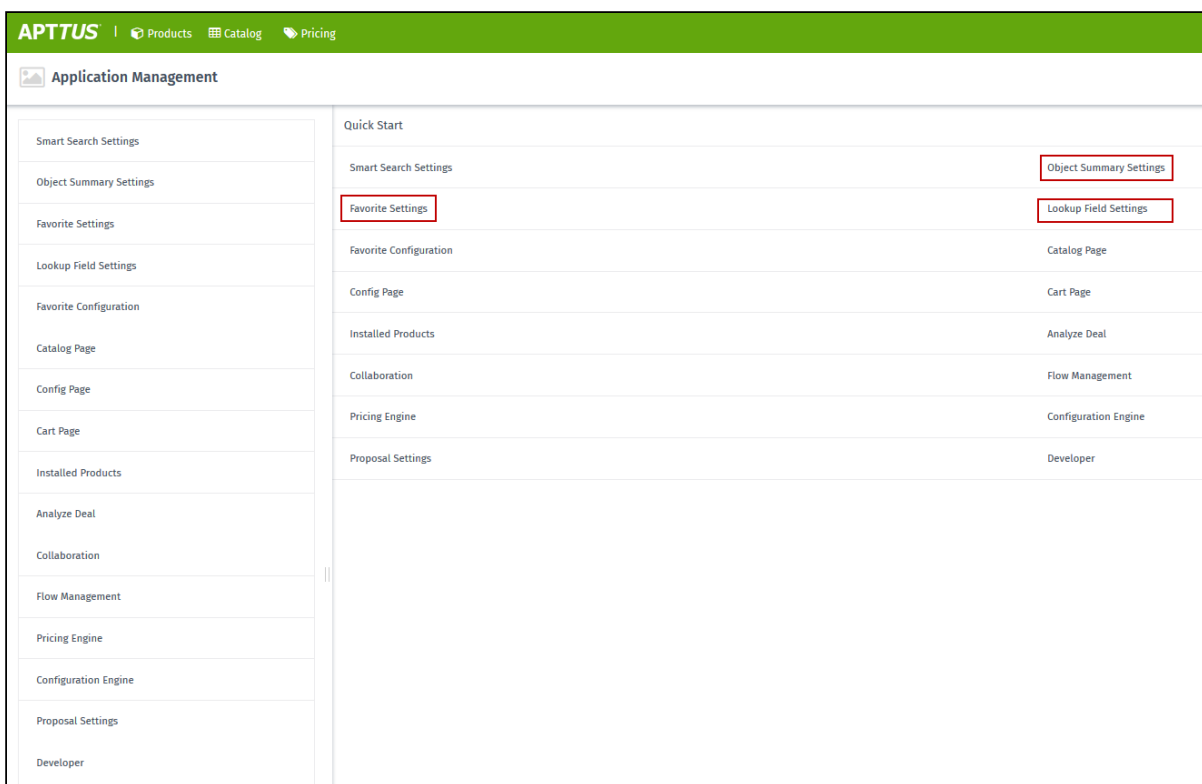

The Application Management Settings allows you to configure and enable pages on the CPQ Admin console to easily configure different settings of the CPQ application from one single URL.

- **Launch from new Admin UI:** Settings can simply be modified by navigating to a new section in the New CPQ Admin user interface, allowing a logical grouping of the settings.

- **Logical grouping of settings:** By default, all settings related to pricing will be grouped together and items related to the Configuration Engine are grouped together.
- **Admin configurable settings:** You can also create your own group settings for customer specific settings that are not part of the standard Apttus CPQ settings.

Navigate to **Admin Console** and from the  drop-down list, click **Application Management**. Click **Load Defaults** to bring the custom settings for the default flow in the Application Management.

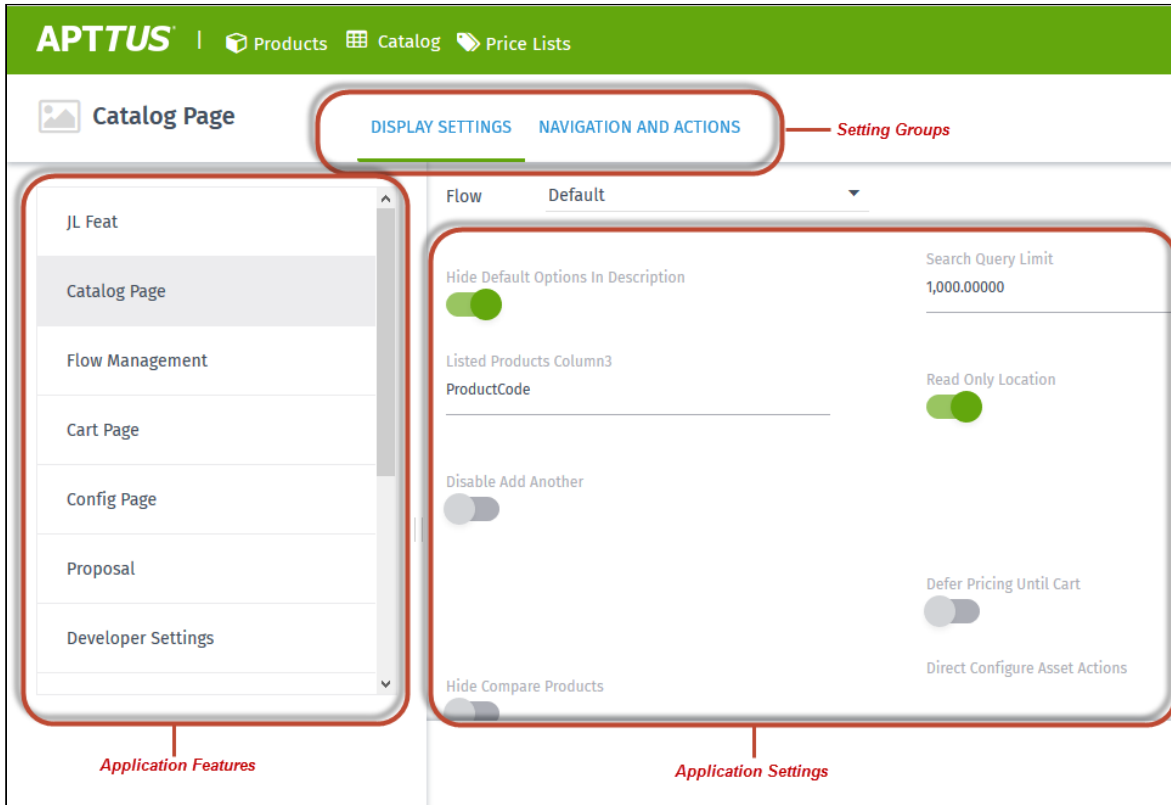

Using the **Load Defaults** functionality on the application management will auto-create the system settings and Apttus suggests you to go with this approach.

Favorites Settings under Application Management lets you manage the favorite product related settings including the default image, the columns in the favorite dialog, and enabling or disabling the favorite settings using the slider. When you disable this setting, the **Save as Favorite** option is not displayed in the cart. For more information on the configuration part, refer to [Configuring Favorite Settings](#).

Lookup Field Settings under Application Management lets you manage the name of the record, an object of the lookup field, field name of lookup field, display columns, and filter criteria. For more information on the configuration part, refer to [Configuring Lookup Field Settings](#).

For Quote, Product, and Favorites objects, you can define “Object summary” fields, which are shown when the user clicks on the link on the catalog such as Product Name or Favorites name. For more information on the configuration part, refer to [Configuring Object Summary Settings](#).

Note that the user with only System Administrator profile can access the Application Management functionality. If you log in through any other user, you will see this error message: *You do not have the level of access necessary to access the Application Management feature. Contact the administrator if access is necessary.*

i The Lookup Field tab available at **CPQ Admin > Application Management > Developer tab** is not functional with the current release.

Optional Configurations

Adding the Application Settings Management Objects as Tabs

Go to **Create > Tabs** and create tabs for the following Objects.

Object	Description
Application Feature	<p>This is a parent tab.</p> <p>The application settings available in Config Settings and Quote/ Proposal System Properties are grouped under Application Features.</p> <p>For example, create an Application feature called as Catalog. You can group all the settings that affect the Catalog page under this application feature.</p>
Setting Group	<p>This is a related list in the Application Feature Visualforce page. Using this page, you can create logical groupings for each of the settings as well as the Flow in which these settings are available in.</p> <p>For example, for the Catalog page, you want to group settings by Display Settings and Navigation and Actions. The Display Setting group can have all the application settings that control the components displayed on the Catalog page, such as Hide Compare Products, Show Quantity. The Navigation and Actions Settings group have all the action and navigation settings such as, redirect to another page on button click without showing the spinner by using the Quick Redirect Action type.</p>
Application Setting	<p>This is a related list in the Setting Group Visualforce page. Each Application Setting has to be defined based on its behavior within a setting group.</p> <p>For example, you can group all application settings controlling the display on the Catalog page together.</p> <p>For example, the Show Quantity application setting will be a part of the Display Setting group.</p>

Creating an Application Feature

When you navigate to the Application Feature tab and click **New** to add and save details in the fields. You can create multiple application features.

Field	Description
Name	Name that you want to give to the application feature. Let's name the Application feature as <i>Catalog Page</i> .
Application Name	The Application in which this feature setting will be applicable. By default the value is CPQ. If you want to add additional values, navigate to the Application Settings object and add additional fields to the Application Name picklist such as CLM.
Feature Name	The feature for which this Application Setting is defined. For example, Cart Page, Catalog Page, Flow Setting, Proposal Settings. You can add values to this picklist by navigating to the Application Settings object and add additional fields to the Application Name picklist. An example of a feature name could be Catalog page, Cart page, or just Application Settings.
Sequence	The sequence in which the Application Feature appears.

The screenshot shows the 'Application Feature Edit' interface for 'Catalog Page'. At the top, there are three buttons: 'Save', 'Save & New', and 'Cancel'. Below this is an 'Information' section with the following fields:

- Name:** Catalog Page
- Application Name:** CPQ (dropdown menu)
- Sequence:** 1
- Owner:** (empty field)
- Feature Name:** Application Settings (dropdown menu)

At the bottom of the form, there are three buttons: 'Save', 'Save & New', and 'Cancel'.

Creating a Setting Group

After you have created an application feature, use the Setting groups' related list from the Application Feature Visual force page to create a new Setting Group. You can create multiple Setting Groups within an Application Feature. Click **New** to add and save details in the following fields:

Field	Description
Sequence	The Sequence in which the Setting group will appear on the New CPQ Admin Page.
Application Feature	The name of the application feature, such as Cart Page.
Setting Group Name	The name you want to give to the Setting Group, such as Display Actions, Cart Views, and so on.
Config Flow	Specify the name of the flow in which the setting group is applicable and visible in.
Display Type	Specifies how the application settings defined in the Setting Group appear. Set the display type on the group based on the Application setting you define in the group. For example, all System settings would have display type as Lists, if all the application settings in the group control or specify custom display actions, the display type would be Actions and so on.
Is Custom	Specifies whether the Setting Group is a custom defined setting group.

The screenshot shows the 'Setting Group Edit' interface for 'Cart Views'. At the top left, there is a logo and the text 'Setting Group Edit' and 'Cart Views'. Below this, the title 'Setting Group Edit' is displayed on the left, and three buttons ('Save', 'Save & New', 'Cancel') are on the right. The main section is titled 'Information' and contains the following fields:

- Application Feature:** A text input field containing 'Cart Page' with a search icon to its right.
- Is Custom:** A checkbox that is currently unchecked.
- Config Flow:** An empty text input field.
- Display Type:** A dropdown menu with 'Custom' selected.
- Setting Group Name:** A text input field containing 'Cart Views'.

At the bottom right of the form, there are three buttons: 'Save', 'Save & New', and 'Cancel'.

Creating an Application Setting

After you have created a Setting Group, use the Application Features related list from the Setting Groups Visualforce page to create a new Application Setting. You can create multiple Application Settings within a Setting Group. Click **New** to add and save details in the following fields:

Field	Description
Setting Group	A lookup to the setting group the application setting will belong to.
Application Setting Name	Specify a name for the application setting.
Record Key	Records associated with the custom setting will be fetched using a record key. When your setting Group is of type Actions or Columns, specify a record key. Record Key is used to identify records in the associated Custom Setting.
Field Label	Name of the application setting. For example, Hide Default Options In Description.
Data Type	This value can be Boolean, number, picklist, text. In our use case, Hide Default Options in Description is a checkbox so the data type will be boolean.

Field	Description
Field Precision	This field specifies the to specify the number of decimal places shown for currency, quantity, and percentage precision fields.
Object Name For Picklist Options	Specify the API Name of an object whose fields are displayed as available options if the setting is a picklist.
Custom Setting Name	Specify the API name of the custom setting which contains the application setting. For example, the Hide Default Options in Description Setting is available in General Page Settings of the Catalog Page which is essentially defined as <code>Apttus_Config2__ConfigSelectConfigProductsSettings__c</code> . So you'll pass the API name of the Setting containing the Application Setting.
Custom Setting Record Name	Name of the custom setting to which the application setting belongs to. For example, Hide Default Options In Description is a part of the Primary Setting. Specify the Record Name as Primary Setting. The values can be System Properties, Primary Settings, Config Custom Classes and so on.
Display Type	Defines how the Application setting is displayed in the CPQ Admin Console page. This value can be Boolean, Multiselect picklist, picklist, text, or radio button. In our use case, Hide Default Options in Description is a checkbox so the data type will be boolean.
Field Name	API name of the custom setting. For example, <code>Apttus_Config2__HideDefaultOptionsInDescription__c</code> .
Default Value	Specify a default value of the setting. For example for HideDefault Options, in Descriptionfield, the value can be set to <i>true</i> .
isPicklist	Is a boolean checkbox specifying whether the application setting is a picklist.
Static Picklist Options	Specify a comma-separated list of the picklist options if the application setting is a picklist.
URL	Specify a URL which provides more information for the custom setting.

Action	Application Setting Name	Custom Setting Name	Custom Setting Record Name	Field Name
Edit Del	Apttus_Config2__DisableAddAnother_c	Apttus_Config2__ConfigSelectedConfigProductsSettings__c	Primary Settings	Apttus_Config2__DisableAddAnother__c
Edit Del	Apttus_Config2__HideSingleTopCategory_c	Apttus_Config2__ConfigSelectedConfigProductsSettings__c	Primary Settings	Apttus_Config2__HideSingleTopCategory__c
Edit Del	Apttus_Config2__EnableCategoryFilter_c	Apttus_Config2__ConfigSelectedConfigProductsSettings__c	Primary Settings	Apttus_Config2__EnableCategoryFilter__c
Edit Del	Apttus_Config2__DeferPricingUntilCart_c	Apttus_Config2__ConfigSystemProperties__c	System Properties	Apttus_Config2__DeferPricingUntilCart__c
Edit Del	Apttus_Config2__HideCompareProducts_c	Apttus_Config2__ConfigSelectedConfigProductsSettings__c	Primary Settings	Apttus_Config2__HideCompareProducts__c
Edit Del	Apttus_Config2__DirectConfigureAssetsActions_c	Apttus_Config2__ConfigSystemProperties__c	System Properties	Apttus_Config2__DirectConfigureAssetsActions__c
Edit Del	Apttus_Config2__HideDefaultOptionsInDescription_c	Apttus_Config2__ConfigSelectedConfigProductsSettings__c	Primary Settings	Apttus_Config2__HideDefaultOptionsInDescription__c
Edit Del	Apttus_Config2__ListProductsColumns_c	Apttus_Config2__ConfigSelectedConfigProductsSettings__c	Primary Settings	Apttus_Config2__ListProductsColumns__c

Configuring Smart Search Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Smart Search Settings**.
4. Configure the following details.

Setting	Description
SEARCH CONNECTION SETTINGS	

Setting	Description
Enhanced Search URL	Specify the URL end point for enhanced product search. With Enhanced Search URL populated with the correct URL, the system synchronizes all the changes at every hour and displays the results in the Review Sync Status section. If you do not specify the Enhanced Search URL , the system neither performs the sync nor updates the information in the Review Sync Status section.
API User Key	Specify the API key that consists of the client ID and is used for smart search related activities. This key is required before Search Activation/ Deactivation and resync. An error is displayed if you activate, deactivate or resync without the API User Key.
PRODUCT FIELD WEIGHTAGE	
Flow	Select a flow and enter the following details. <ul style="list-style-type: none"> • Field Name • Typeahead • Weightage

Configuring Favorite Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Favorite Settings**.
4. Enter details in one or more of the following sections, based on your organization's requirement.

Setting	Description
Disable Favorites	Disables the Favorites category on the catalog, Save As My Fav button on the cart and any UI elements related to Favorite Configurations on catalog, configuration and cart pages. By default, this checkbox is not selected.
Listed Favorite Configuration Column1	Enter the API name of the favorite configuration field that you want to display on the catalog page for your favorite configuration records. You can enter a maximum of one API names. If you have a requirement of displaying one more field, use Listed Favorite Configurations Column 2 custom setting.

Setting	Description
Save as Favorite Dialog Columns	Enter comma-separated API names of the columns that you want to display on the Save As My Favorite dialog box on the cart.
Favorites Category Image	You can choose an image to upload for your group of favorite configuration category. This image is displayed under your favorites (as entered in Favorites Display Label) category on the catalog page. By default, no image is set.
Listed Favorite Configuration Column2	Enter the API name of the favorite configuration field that you want to display on the catalog page for your favorite configuration records. You can enter a maximum of one API name.

Configuring Catalog Page Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Catalog Page**.
4. Configure the following details.

Setting	Description
NAVIGATION AND ACTIONS	
Flow	Select a flow and enter the following details. <ul style="list-style-type: none"> • Display As: • Action Area: • Action Style Class: • Is Enabled: • Always Display:
DISPLAY SETTINGS	
Hide Help Me Choose	Indicates whether to hide the Guided Selling link. By default this is not selected and the system shows Guided Selling link on the Catalog page for the respective categories.

Setting	Description
Hide Configure Action	Hides the Configure action for a Product on the catalog page.
Hide Listed Products Price Column	Hides the price information column in listed product section. By default, this is not selected.
Listed Products Column3	(optional) Type the API name of the product field to display in the listed products section. Example Value: ProductCode
Search Category Default	Indicates the category to default to when searching for products using the search text box on the product selection page. The default value is All Categories. Select All Products to search all products regardless of categories.
Enable Category Filter	Filters the categories based on search results and displays in the Narrow Your Search area on the left. For example, if the search result has products from only two categories, the Narrow Your Search section displays only those two categories. <div style="border: 1px solid green; padding: 5px; margin-top: 10px;">  You should always select Enable Category Filter when Hide Narrow Your Search is cleared. </div>
Hide Compare Products	Disables the Compare Products feature in the catalog page.
Hide Default Options In Description	Hides the default options listed below the product description.
Listed Products Column2	(optional) Type the API name of the product field to display in the listed products section. Example Value: ProductCode
Show Quantity Input	Displays the Quantity field on the catalog page.
Hide Single Top Category	Hides the top category. This property is useful only when you have a single root category and want to have a cleaner look for all of its child categories, without the root category.

Configuring Cart Page Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Cart Page**.
4. Configure the following details.

Setting	Description
DISPLAY SETTINGS	
Enable Auto Sequencing For Options	Enables auto sequencing for options. If you do not select this option, the Option Item Sequence in the shopping cart and the Line Items is based on the user selection sequence rather than the Bundle Options sequence.
Product Display Max Length	Captures the maximum no of characters to be displayed for the product name on the cart page. If the product name exceeds the maximum length, the ellipsis is shown. The default value is 21.
Expand Bundles in Cart	<p>Expands all attributes and options of a bundle product in the cart.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Pagination feature is not supported along with Expand Bundles in Cart.</p> </div>
GroupBy Fields	Specify the API names of those line item fields that are of the type: Lookup, Formula Fields, and Text. These line item fields are shown under the Group By drop down on the cart page. For example, for Group By PriceList, specify the API name of the field that is a lookup to the pricelist object. These fields are also used in the new Cart View feature available under Viewing the Cart in Grid View section in the User Guide.
Hide Subtotals In Cart	Indicates whether subtotals should be hidden in the cart view. The default value is false (show subtotals in the cart). When checked, the system hides subtotal lines in the Summary section, and still shows Category Total, One Time Total, and Grand Total.
Show Recommended Products Cart View	Displays the recommended products component in the Cart Detail View page.

Setting	Description
Show Attributes in Cart	Shows the specified attributes applicable to the line items in the cart. Attributes appear in the product dialog.
Hide Copy Action	Hides the copy action in the cart. The default value is false (copy icon is displayed).
Hide Grand Total	Hides the grand total line on the cart page.
View Cart Total Custom Fields	Enter the list of custom fields from the summary group object displayed in the custom view cart page. Each field API name should be separated by a new line or a comma.

Configuring Flow Management Settings

This page contains the settings to determine the custom or out-of-the-box pages when an end user clicks **Configure Products** button. Once setup, these flow settings override the Visualforce pages setup in custom settings.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Flow Management**.
4. Enter details in one or more of the following sections, based on your organization's requirement.

Setting	Description
Flow Name	Type a mandatory name for the flow.
AssetsPage	Type the Visualforce page name for assets. Valid values are: <ul style="list-style-type: none"> • SelectInstalledProducts • SelectInstalledProductsEn

Setting	Description
<p>CartPage</p>	<p>Type the Visualforce page name for cart. Valid values are:</p> <ul style="list-style-type: none"> • Apttus_Config2__CartDetailView • Apttus_Config2__CartView <p>If you want to view the cart with the new Grid UI, name the cart page as <i>Apttus_Config2__Cart#cartgrid</i>.</p>
<p>CatalogPage</p>	<p>Type the Visualforce page name for product selection. Valid values are:</p> <ul style="list-style-type: none"> • Apttus_Config2__SelectConfigProducts • Apttus_Config2__SelectConfigProductsFilterView
<p>OptionsPage</p>	<p>Type the options page to capture the options for a bundle product. Valid values are:</p> <ul style="list-style-type: none"> • Apttus_Config2__ConfigureBundle • Apttus_Config2__SelectConfigOptions • Apttus_Config2__SelectConfigOptionsTab View • Apttus_Config2__SelectConfigOptionsList View • Apttus_Config2__SelectConfigOptionsTreeView • Apttus_Config2__SelectConfigOptionsDetailView • Apttus_Config2__SelectBundleOptions <div style="border: 1px solid #ffc107; padding: 5px; margin-top: 10px;"> <p> Do not use the <i>SelectBundleOptions</i> page from your drop-down list, it is no longer supported.</p> </div>
<p>ProductAttributeDetailPage</p>	<p>Type the Visualforce page name to capture product attribute detail information. Valid value is:</p> <ul style="list-style-type: none"> • Apttus_Config2__ProductAttributeDetail3

Configuring Configuration Engine Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Configuration Engine**.
4. Configure the following details.

Setting	Description
CONSTRAINT RULES	
Disable Constraint Rules	Indicates whether constraint rules are disabled. This may be used to optimize performance when constraints are not used in the organization. The default value is false (enabled).
Defer Validation Check In Bundles	Defers the validation check in the bundle configuration step. This is selected by default.
Show Checkbox In Rule Dialog	Enables check box to select multiple products in the Inclusion Constraint Rules dialog at once, instead of adding the products individually using Add to Cart. This setting works for <i>Inclusion Rule</i> with Min/Max Match Rule as <i>Include Min/Max</i> .
Max Constraint Rules Round Trip	This is the maximum number of round trips after which the constraint rule processing should stop. Round trip happens only when auto included products trigger more rules. The default value is 3.
ATTRIBUTES	
Cascade Shared Attribute Updates	Cascades the shared bundle attribute updates to options in the bundle. If this setting is unchecked, the bundle attributes will initially be cascaded to options in the bundle, but subsequent changes in the bundle attribute will not be cascaded to option attributes.
EXPRESSIONS	
Enable Field Expressions	Enables you to use Expression Builder for attributes, option groups, and options.

Configuring Developer Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.

2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Developer**.
4. Configure the following details.

Setting	Description
SYSTEM GLOBAL	
Instance URL	The Salesforce instance URL (for example, https://na7.salesforce.com/). The instance URL is required to navigate to custom pages in the managed package.
CSS Override	Type the name of the static resource to override CSS in the catalog, attributes, options, and cart pages.
Auto Update Category View	Indicates whether auto incremental updates to category view are enabled.
Keep Abandoned Carts	Indicates whether abandoned carts should be kept. The default value is false (abandoned carts are moved to the recycle bin).
Bypass Shopping Cart	Displays the Update Price and Finalize buttons and hides the Go To Pricing button on all the new pages. On the configuration page, only the Go To Pricing button is disabled. You can still finalize the quote using the Mini cart.
FIELD PRECISION	
Percentage Field Precision	Type a number to specify decimal places for percentage precision. The default percentage precision is 2 decimal places.
Quantity Field Precision	Type a number to specify decimal places for quantity precision. The default quantity precision is 2 decimal places.
Currency Field Precision	Type a number to specify decimal places for currency precision. The default currency precision is 2 decimal places.
Term Field Precision	Type the precision value that you want to display for the Selling Term column on the shopping cart. For example, if your term calculation results to 4.553412 and you have set Term Field Precision to 3, the Selling Term column displays 4.553. The default term precision is 5 decimals. This setting is applicable only for the New UI.
FINALIZATION & APPROVALS	

Setting	Description
Run Misc Finalization Task In Async Mode	Indicates whether the secondary finalization task (attributes, usage tiers, etc) should be run asynchronously
Auto Sync On Cart Approval	Automatically synchronizes the cart when approved and finalized.
Auto Finalize On Cart Approval	Automatically finalizes the cart when the quote gets approved.

Configuring Object Summary Settings

In order to show the summary information for the Proposal (cart header) and Product in the Salesforce Lightning Experience, a new custom setting named **Object Summary Settings** is now available.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Object Summary Settings**.
4. Configure the following details.

For Proposal Summary

Field Name	Description
Name	Specify the name as: Proposal Summary
Object Name	Specify the object name as: <i>Apttus_Proposal__Proposal__c</i>
Display Fields	Specify the API names as: <i>Name,Apttus_Proposal__Proposal_Name__c,Apttus_Proposal__Account__c,PriceListId__c</i>

You can specify any Quote/Proposal field in a comma-separated list.

For Product Summary

Field Name	Description
Name	Specify the name as: Product Summary
Object Name	Specify the object name as: <i>Product2</i>

Field Name	Description
Display Fields	Specify the API names as: <i>Name,Description,Family</i>

You can specify any Product2 field in a comma-separated list.

On the catalog page, when you click **Proposal ID** on the top left corner, you see proposal summary with the fields configured in Proposal Summary.

Similarly, when you click **Product Name** on the catalog page, you see product summary page with the fields configured in Product Summary.

If there is no **Object Summary Setting** defined in the system, only Name will be displayed by default when you open the Proposal or Product summary dialog box.

For Favorite Configurations

Field Name	Description
Name	Specify the name as: <i>Favorite Configuration</i>
Object Name	Specify the object name as: <i>Apttus_Config2__FavoriteConfiguration__c</i>
Display Fields	Specify the API names as: <i>Name,Apttus_Config2__PriceListId__c,Apttus_Config2__ConfigurationId__c</i>

Configuring Lookup Field Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Lookup Field Settings**.
4. Configure the following details.

Setting	Description
LOOKUP FIELD SETTINGS	
Name	Specify the name for the custom setting.

Setting	Description
Object Name	Select one from the dropdown menu. <ul style="list-style-type: none"> • Collaboration Request • Line Item • Product Attribute
Lookup Field Name	Select the name of the field from the dropdown menu. The values are populated based on the Object you select. This is the lookup field containing values such as <i>Enterprise, Standard, and Premium</i> .
Filter Criteria	Enter a valid expression to further filter down the search results for a lookup. The field size is 256 characters. Example: Product__c=Apttus_Config2__ProductAttributeValue__c.Product_Id__c This will fetch only such attributes whose IDs match with the selected products. Here, the ProductId is a custom formula field which fetches the Product Id of the Line Item object.
Lookup Display Columns	Select the fields to be displayed on the lookup dialog box.
Lookup Record Limit	Click the  icon, enter the maximum number of records to query for the lookup field dropdown, and click Save . Default value is 200 to a maximum of 1000.
Junction Object Name	Click the  icon, enter the name of the junction object which you would like to filter the lookup values, and click Save . This is a custom object that you can define to filter the values which do not exist on the Lookup Object itself.
Junction Field Name	Click the  icon, enter the name of a field on the junction object which you would like to filter the lookup field by, and click Save .
Junction Default Flag	Click the  icon, enter the name of a field API from the Junction object to determine the default value of a lookup field, and click Save . This field must be a checkbox.

Setting	Description
Filter Criteria 2	 This field is not available in the CPQ Admin UI. You must use Setup > Build > Develop > Custom Settings > Lookup Field Settings to configure it.

Configuring Config Page Settings

This page lists all the custom settings you may require to set up the Options page. You can enter details in one or more of the following sections, based on your organizations' requirement.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Config Page**.
4. Configure the following details.

Setting	Description
DISPLAY SETTINGS	
Hide Disabled Options	Hide the options that have been disabled by the exclusion rules. Such options will not be shown in the list of available options. Also, if all such disable options are under one option group, this group is also hidden on the configuration page.
Listed Options Column 2	Type the API name of the product field to display in the listed options section.
Show Option Quantity	Displays the Quantity in the body of the options pages. This setting controls the SelectConfigOptionsDetailView and ConfigureBundle page.
Disable Add To Cart for Option Products	Hides the Add To Cart and Configure buttons on the Catalog page for an option product. This is helpful to prevent your sales representative from selling an option product without its bundle product.
Show Bundle Detail	Shows the bundle details in the options page.
Hide Price Column	Disables the price column from the options page.

Setting	Description
Listed Options Column 3	Type the API name of the product field to display in the listed options section.
Collapse All Leaf Option Groups	Collapses all the leaf option groups in the Config Options Detail View page.
Show Tab View	Displays option groups as tabs instead of sections in the options page. You can enable the Show Tab View setting at a product level also. Select the check box on the product details page.
Bundle Description Field	Type the field names from the product object to be displayed as bundle description.
NAVIGATION AND ACTIONS	
Flow	Select a flow and enter the following details. <ul style="list-style-type: none"> • Display As: • Action Area: • Action Style Class: • Always Display:

Configuring Installed Products Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Installed Products**.
4. Configure the following details.

Setting	Description
NAVIGATION AND ACTIONS	
Flow	Select a flow and enter the following details. <ul style="list-style-type: none"> • Display As: • Action Area: • Action Style Class: • Always Display:
COLUMNS	

Setting	Description
Flow	Select a flow and enter the following details. <ul style="list-style-type: none"> • Field Name • Is Sortable • Style • Style Class • Header Style
GENERAL SETTINGS	
Direct Configure Asset Actions	This setting is no longer supported. Instead, you can use the Allowed Actions setting to configure asset actions at each Asset Line Item. Also, you can use the Hide Asset Actions setting to hide the action buttons from users on the Installed Products page.
Submenu Actions	Enter comma-separated submenu actions that you want to display when the user clicks an action button on the Installed Products page. You can configure submenu actions only on the Change and Relate actions. The supported values are: <ul style="list-style-type: none"> • Change:Configuration displays the Configuration submenu under the Change action. This submenu enables users to configure an asset line item. • Change:Quantity displays the Quantity submenu under the Change action. This submenu enables users to initiate an action to add more licenses for an existing asset stream. • Change:Split displays the Split submenu under the Change action. This submenu enables users to split an asset into multiple split lines. • Change:Merge displays the Merge submenu under the Change action. This submenu enables users to merge multiple asset lines into a single asset. • Relate:Component displays the Component submenu as a drop-down under the Relate action. This submenu enables users to relate an asset component with a service.
Show Accounts Filter	Selecting this displays the account filter in the installed products page. This is currently not supported.

Setting	Description
Filter Fields	Type the <i>API name</i> of Asset Line Fields to be displayed on the Filter By panel. Works with text fields, Picklist, Multi-picklist, Date, DateTime and Boolean. Commonly used fields are Start Date, End Date, Lead Time Expiration, and Asset Status . Usually, all fields under Asset Line Item object are supported but you must enter <i>ExpirationLeadTimeInDays</i> value in order to display Lead Time Expiration field in the Search pane.
Hide Co-Term	Hides the Coterminate with Increment panel on the Change Quantity (Increment Asset) page. The Coterminate with Increment panel is displayed by default.
Show Assets	Select the account hierarchy that the user must see on the Installed products page. Select from the following settings: Parent and Children: The entire account hierarchy including the parent and children are displayed. Parent: Only parent accounts are displayed. Children: Only children accounts are displayed.
Hide Asset Actions	Type comma-separated values of Increment, Amend, Renew, and Cancel actions. Listed actions will be hidden from the users. You can configure asset actions at each Asset Line Item.
Max Renews Per Trip	Type the maximum number of renewals per trip. To prevent CPU timeout use a smaller number. The default is 20.
Amend Change Fields	Type comma separated line item field names whose values can turn an existing asset line into an amended asset line. This setting is no longer used. All the editable fields honor the flow settings configured for the Cart.
Default Renewal Term	Type a value for a renewal term. When the value is provided use this value as the renewal term for Renewing products. The value here denotes months to renew as the end date. Ideally, your Selling Term is equal to your Default Renewal Term .
Allow Backdated Termination	Enables you to terminate an asset by specifying an end date to any date prior to the current date. End date should be greater than the start date. Backdated Termination is supported out-of-the-box.
RENEWAL	

Setting	Description
Renewal Lead Time	<p>Indicates when the Renewal Opportunity will be created after an Order is activated.</p> <p>By default, the value is 0, which indicates that the Renewal Opportunity is created immediately after the Order is activated, with the same number of Line Items in the Order. If you specify 30, the Renewal Opportunity is created 30 days before the Asset End Date.</p>
Default Renewal Price List	Specify the Name of the Price List which is a mandatory field for Quote creation.
Renewal Default Price Book	Enter a Renewal Price Book name which you want to associate with renewals.
Renewal Group Fields	<p>Indicates how to group the Asset Line Items when a Renewal Opportunity is created. Specify the API names of the fields you want to use for grouping.</p> <ul style="list-style-type: none"> • For Execution mode set to Auto, the system will group the renewal Opportunity by default by the Auto Renew Flag - One for the Asset Lines with Auto Renew as <i>True</i> and the other for Asset Lines with Auto Renew as <i>False</i>. • For Execution mode set to OnDemand, the system can group the renewal Opportunity by Account and the Price List. <p>If the implementation teams want to group the renewal opportunities by other parameters on the Asset Line Item (for example, end date, product family, or any custom fields), they can do so by specifying a comma-separated list of API names of the fields in this section. It is recommended to limit the grouping to a maximum of 4 fields.</p>
Renewal Execution Mode	<p>Indicates if the Renewal of Asset Line Items must happen automatically or based on your specified conditions.</p> <ul style="list-style-type: none"> • Enter Auto to automatically create the Renewal Opportunity on Order activation. Make sure you check Auto Renew on the product PLI, from the Default tab. • Enter OnDemand to create the renewal Opportunity before a certain lead time. You must enter a Renewal Lead Time for this mode to work successfully. To create a renewal Opportunity 90 days before the Asset Expiry, set the Execution Mode to <i>OnDemand</i> and Renewal Lead Time to <i>90</i>.

Setting	Description
Renewal Business Object Type	Enter the Business object for which this renewal is taking place. Currently, <i>Proposal</i> and <i>Agreement</i> are supported.
MISCELLANEOUS	
Enable One Time Change	<p>Select this flag to enable modifications or amendment to one-time assets. This is a global setting and cannot be restricted to apply for specific products. You can perform only amendments on one-time assets and not renewals.</p> <p>If you deselect this and modify the asset, the renewal quote is updated for the modified asset. If you set it to <i>false</i>, Renewal Opportunity and Renewal Quote are not created for the one-time only products, but if you modify the asset, the change is reflected in the Renewal Quote.</p> <p>If you set it to <i>true</i>, Renewal Opportunity and Renewal Quote is not created for one time.</p> <p>It is recommended that you treat one-time assets purely as one-time sales. Any modifications or renewals should not be encouraged for one-time assets.</p>
Allow Mass Change	You can enable or disable mass changes for <i>must configure</i> assets with the help of this setting.
Create Renewal Opportunity	<p>Indicates if you want to create renewal opportunities along with renewal quotes. By default, this check box is not selected. This is to prevent the system from running into locking issues when an account has a large number of assets and the batch process creates the renewal opportunities for all these assets.</p> <p>When set to true, the Create Renewal Opportunity scheduled job runs and creates the renewal opportunities along with renewal quotes.</p> <p>When set to false, the Create Renewal Opportunity scheduled job runs and does not create the renewal opportunities and creates only the renewal quote.</p>

Setting	Description
Renew One Ramp	<p>Consider a scenario where multiple ramped assets exist for a quote. In the previous releases, renewing any one of the ramped assets results in the creation of a renewal cart with the same number of ramps as the original proposal. Each ramp line is created from the original deal which implies that the uplift has to be defined from Ramp 1 for accurate prices in the subsequent ramps. Redefining and specifying details for each ramp can be cumbersome and as a user, you would expect that for a three-year ramped deal, the uplift specified on year 3 is applied on renewal to year 4.</p> <p>This setting enables you to renew only one ramp line item based on the new term in order of renewal term in the asset line item, default renewal term specified in the Installed Product Setting and Selling Term defined in the asset line item.</p>
Account Hierarchy Batch Size	Indicates the number of Account Hierarchy records processed for each batch execution. Recommended value is 500. Valid values range from 1 to 2000.
COTERMINATION PREFERENCES	
End Date preferences for Cotermination	<p>Enables you to decide what End Date preferences the user should see while coterminating incremental licenses using the Change:Quantity action. For information on coterminating assets, refer to "Increment Asset with Coterminate Lines" in <i>CPQ on Salesforce Summer 2020 User Guide</i>. The supported values are:</p> <ul style="list-style-type: none"> • RetainCurrentAssetEndDate: This option enables the user to retain the current asset end date for cotermination. • UseCustomDate: This option enables the user to enter a custom date for cotermination. • UseProposalEndDate: This option enables the user to use the proposal end date for cotermination.
Default Cotermination Option	From the Default Cotermination Option drop-down list, select the cotermination option that you want to set as default.
ASSET SOURCE	

Setting	Description
Asset Source	<p>Allows you to filter the assets to be displayed on the Installed Products page based on the Ship To or Sold To or Bill To fields of an account. By default, all the assets filtered with the Sold To field are displayed. Specify the API name of the Account field that you want to use as a source for displaying assets. For example, to filter the assets based on Ship To field, enter <code>Apttus_Config2__ShipToAccountId__c</code>. You can specify all the three account fields and the system considers an OR condition between these fields while filtering. This is useful when an account has different locations for shipping and billing and you want to display only those assets that have been shipped to a certain location.</p>
PURCHASE ID CRITERIA	
Purchase Id Criteria	<p>Allows user to define a criteria to get coterminate related asset lines in the Coternimate with Increment section on the Change Quantity page during asset increment. The default purchase identification criteria are: Product, Charge Type, Option, and Account.</p> <p>From the Available Purchase Identification Criteria list, add the required criteria to the Selected Purchase Identification Criteria list. CPQ currently supports only Purchase Identifier and alphanumeric custom fields.</p> <p>For example, if you select Purchase Identifier, during increment of a selected asset, all other assets with the same Purchase Identifier are displayed on the Coternimate with Increment section.</p> <div data-bbox="493 1305 1426 1469" style="border: 1px solid #f0e68c; padding: 10px; margin: 10px 0;"> <p> If you add <i>Quantity</i>, <i>Selling Term</i>, or <i>End Date</i> to the Selected Purchase Identification Criteria, the user will receive an error on order creation or activation.</p> </div> <p>Based on the selected purchase identification criteria, the total quantity of an asset spans multiple streams during the increment scenarios, on the Installed Products page (of a renewal quote).</p>
SPLIT ASSET ACTIONS	

Setting	Description
Split Asset Actions	<p>Enables the user to perform split asset actions on the Define Split <asset name> page. Add the required split asset action from the Available Split Asset Actions to Selected Split Asset Actions list. Supported options are:</p> <ul style="list-style-type: none"> • Renew: Enables users to perform the Split and Renew asset action. • Swap: Enables users to perform the Split and Swap asset action.
ASSET VIEWS	
<p>You can create a view and share it with selected users to be displayed as a view on the Assets grid. Users can only select this view, but they cannot edit or delete it. Only you can edit or delete the view as an administrator.</p>	
Flow	Select a flow for the view.
View	Select New to create a view.
Name	Enter a name for the view.
Default View	Turn on this button to make this view as the default view.
Make Public	Turn on this button to make this view public.
User Types	<p>Select one of the following user types:</p> <ul style="list-style-type: none"> • User Profiles • User Roles • Users <p>After selecting the user type, move the respective user from the Available list to the Selected list.</p>
Field Name	Add the fields to be displayed as columns in the view for users on the Assets grid.
ASSET TERMINATION FIELDS	
Asset Termination Fields	<div style="border: 1px solid red; padding: 10px;"> <p> Do not use this setting. Instead use the <i>Asset Termination</i> option from the Display Type picklist. For more information, see Configuring Display Columns Settings.</p> </div>
MERGE ACTION CRITERIA	

Setting	Description
Merge Action Criteria Fields	Select the fields that must be common among the asset line items to be merged. The default fields are product, charge type, selling term, and price type.
EDITABLE FIELDS FOR CANCELLED LINES	
Editable Fields for Cancelled Lines	<p>Select the fields that you want to make editable for cancelled lines on the cart (during asset termination).</p> <p>You can select a custom currency field that is not based on a formula. All out-of-the-box currency fields such as base price and base extended price are not visible in the list of editable fields.</p> <p>Sensitive managed package fields that the user cannot edit on a cancelled line item are not visible in the multi-select picklist to the user.</p>

Configuring Collaboration Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Collaboration**.
4. Configure the following details.

Setting	Description
PARENT LINE ITEM COLUMNS	
Flow	<p>Select a flow and enter the following details.</p> <ul style="list-style-type: none"> • Field Name • Is Sortable • Style • Style Class • Header Style
CHILD LINE ITEM COLUMNS	
Flow	<p>Select a flow and enter the following details.</p> <ul style="list-style-type: none"> • Field Name • Is Sortable • Style • Style Class • Header Style

Configuring Pricing Engine Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Pricing Engine**.
4. Configure the following details.

Setting	Description
GLOBAL PRICING	
Enable External Pricing	Indicates whether pricing will be done externally. The default value is false (disabled).
Defer Pricing	<p>Performs pricing of products only after you click the Go to Pricing button; whereas, clearing this check box enables the system to perform pricing as and when you add or delete products.</p> <p>The user can see the Update Price button on the Configuration page only if you enable the Defer Pricing setting.</p> <p>CPQ allows you to selectively turn on or off Defer Pricing at a flow level. You must set the deferPricingUntilCart parameter to True in the URL that you have configured on the Configure Products field of the respective quote. For more information, see Creating Custom Buttons for Different Flows.</p>
Pricing Profile	<p>Type Basic, Advanced, or External.</p> <p>A pricing profile is Basic, when there are none of the following used:</p> <ul style="list-style-type: none"> • Pricing Rules • Price Matrices • Related Pricing Setup • Bundles <p>Note: If the Pricing Profile field is left blank, the default value is Advanced.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> You can configure this setting based on a flow. In such case, the flow-based setting overrides the generic setting.</p> </div>

Setting	Description
TOTALING AND SUBTOTALING	
<p> CPQ allows you to selectively skip totaling at a flow level. You must set the isCartTotalingDisabled parameter to True in the URL that you have configured on the Configure Products field of the respective quote. For more information, see Creating Custom Buttons for Different Flows.</p>	
Totaling Group Type	<p>Type the default value for summary group type picklist. Valid values are:</p> <ul style="list-style-type: none"> • <i>Category</i>: When you add a product to the cart from the lowest leaf category where it is associated, the Category Hierarchy column in the Line Items related list is populated with its bread-crum trail. This is useful to identify the exact category from where the product was added, in case if the product is associated with multiple categories. • <i>Product</i> <p>The default value is <i>Category</i>. For Product-based totaling, the Product Totaling Hierarchy setting is required.</p>
Adhoc/Product Totaling Hierarchy	Enter the list of product fields that represent the product totaling hierarchy. Each product field API name should be separated by a new line. Only applicable when Product based totaling is in effect.
Disable Charge Type Totaling	Disables the totaling of charge types.
Compute Totals In Separate Step	Indicates whether the totaling should be performed in a separate step or it should be combined with the base pricing step. This setting ensures that the totaling, which is dependent on the number of lines, should be done as a separate remoting call. This setting helps to avoid the CPU time limit issue to a large extent.
ADVANCED PRICING	
Enable Aggregate Pricing	Indicates whether aggregate pricing is enabled. This may be used to optimize performance when aggregate price rules are not used in the organization. The default value is false (disabled).
Enable Matrix Pricing For Options	Indicates whether matrix pricing is enabled for options. This may be used to optimize performance when options do not use price matrices in the organization. The default value is false (disabled).

Setting	Description
Max Adjustment Lines	Type the maximum number of discount lines allowed for a line item. The default value is one. You can create more than one adjustment only when the value is greater than one.
Enable Keyed Matrix Pricing	Select this if you have option products with large number of dimensions of type discrete. This also helps in reducing SOQL queries.
Enable Auto Reprice	Automatically reprices the cart. In the cart, when you modify pricing and tab out, the system automatically recalculates and displays the price.

Configuring Proposal Settings

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Application Management**.
3. Click **Proposal Settings**.
4. Configure the following details.

Setting	Description
DEFAULT	
Default Opportunity Quote Owner	Type the owner name to set the default owner for the quote/proposal created from an opportunity. Valid values are: <ul style="list-style-type: none"> • Opportunity Owner • Current User If not set, Opportunity Owner becomes the owner of the new quote/proposal.
Disable Opportunity Products Copy	Disables copying of opportunity products to the quote/proposal.
Default Quote Agreement Owner	Type <i>Quote Owner</i> or <i>Current User</i> to set the default owner for the agreement created from a quote/proposal. If not set, <i>Quote Owner</i> becomes the default owner of the new agreement.
Email Template For Presenting Proposals	Type the name of the email template to use for presenting proposals.

Setting	Description
SYNCING	
Auto Sync With Opportunity	Automatically synchronizes the quote line items with the opportunity, when the proposal is finalized. This setting appears only if you have Apttus Quote/Proposal-Configuration Integration package installed.
Sync Option Products	Synchronizes options along with bundles when you click Sync with Opportunity for your proposal. The default is to synchronize bundle only. This setting appears only if you have Apttus Quote/Proposal-Configuration Integration package installed.
Sync Bundle Using Line Items	Synchronizes bundle products using proposal line items. The default uses proposal summary objects. This setting appears only if you have Apttus Quote/Proposal-Configuration Integration package installed.
MERGE SERVICE	
Instance Url	Type the Salesforce instance URL. For example: https://na7.salesforce.com This is required to navigate to custom pages in the managed package.
Merge Webservice Endpoint	Type the Apttus merge webservice endpoint.
Merge Call Timeout Millis	Type a number to indicate timeout in milliseconds for the merge request. For example: 60,000
Max Child Level	Type the maximum level to generate the merge data for the proposal.
ESIGN	
Auto Select Attachment?	Select this setting to enable CPQ to select the most recent attachment automatically.

Setting	Description
Auto-Select multiple recipients?	Select this setting to enable projects to specify a list of recipients that will be defaulted for eSignature. To use this option, projects will add the DocuSign Default Recipients related list on proposals and user will select the list for each proposal.
Auto Select Recipient Field Name	Enter the API name of the field which holds the value for the recipient to select automatically.
SECURITY	
PDF Owner Password	Type the password required to change permissions of the PDF document like printing or editing.
Enable PDF Security	Enabling PDF security lets users apply security settings to PDF documents and protect them with a password.

Configuring Custom Settings

This is the standard Salesforce Custom Settings page that lists all the legacy custom settings you may require to fulfill your specific business requirements. You can access these settings from **Setup > App Setup > Develop > Events > Custom Settings**. Click **Manage** next to the setting.

 Some of the custom settings listed on this page may require you to contact Apttus Support or Apttus Professional Services to guide you through using these settings for specific business use cases.
In your org, you may see custom settings that are not listed in this document—these custom settings are not functional and are marked as Deprecated (D).

Base Private Properties

This custom setting holds the list of all the base library properties.

Setting	Description
Enable Usage Data	Select this to enable data usage.
Usage Data Endpoint	Enter the usage data endpoint.

Setting	Description
Usage Data Key	Enter the usage data key
Usage Data Provider Class	Enter a list of comma-separated class names of Usage Data Providers specifically the class that implements Apttus_Base2.IUsageData interface.
Usage Event Key	Enter the usage event key.

Comply System Properties

This custom setting holds the lists all the Comply system properties. You can enter one or more of the following property details.

Setting	Description
Admin User	The admin user is the default owner of activities created by a user who is not allowed to be the owner (for example, customer portal user). Enter the admin user name as first name, last name.
Auto Enable PDF For Final Docs	Select this and the Create PDF Attachment check box is always selected when you choose to save as <i>Final - to be signed</i> from the check-in dialog. You may use this field when you want to finalize an agreement document.
Auto Enable Reconciliation	Select this and the <i>Reconcile Document</i> option is always selected when you go to check-in an agreement document.
Agreement Number Field For Imported Docs	In this field, specify the API name of the field you want to use. For example, use <code>Apttus__Agreement_Number__c</code> . When a new document is imported into the system, it will include the agreement number in the top right corner of the header on each page, using the field selected above. For more information about when to use this field, refer to Agreement Number/Header Configuration in <i>Contract Management Administrator Guide</i> .
Allow PDF Select Override	This is only applicable when Auto Enable PDF For Final Docs is selected.
Allow Reconcile Selection Override	This is only applicable when Auto Enable Reconciliation is selected.
Auto Create Order	Select this check box if you want to create an order and asset as soon as an agreement is activated. This is useful when you want to integrate Assets with Contracts.

Setting	Description
Auto Enable Private Indicator	Select this check box if you want to auto enable private indicator for documents. If you select this check box, the Make this document private check box for any agreement document is auto selected.
Auto Insert Header Footer Data	Select this field to automatically insert the Agreement Number Field For Imported Docs field value to the header and the latest timestamp to the footer of an agreement document. This field is available for Generate, Import and Offline actions. For more information about when to use this field, refer Agreement Number/Header Configuration in <i>Contract Management Administrator Guide</i> .
Allow Private Selection Override	Select this check box if you want to allow the user to override the private document selection. This setting is applicable only when Auto Enable Private Indicator is selected for documents.
Auto Sync With Opportunity	Indicates whether the agreement will be automatically synchronized with the opportunity when the agreement is accepted. This setting appears only if you have Apttus Contract-Configuration Integration package installed.
Enable PDF Security	Enabling PDF security lets users apply security settings to PDF documents and protect them with a password.
Bypass Sharing	Indicates whether apex code can bypass record sharing during selective operations such as clone and deleting draft attachments.
Contract Summary Template	This field contains the name of the contract summary template. You may have to define a separate template to contain the contract summary details and mention the name of the template here.
Default Opportunity Agreement Owner	Type <i>Opportunity Owner</i> or <i>Current User</i> to set the default owner for the quote/proposal created from an opportunity. If not set, <i>Opportunity Owner</i> becomes the default owner.

Setting	Description
Default Document Tags	<p>Enter a comma-separated list of tags to make available for any agreement document as it is checked in from X-Author Contracts. Use of these tags requires Contract Document Versioning to be enabled. The Document Finder feature must also be configured in your org. For more information, refer to Configuring Document Finder in <i>Contract Management Administrator Guide</i>.</p>
Document Naming Convention	<p>Specify a value to apply a custom naming convention for all proposal documents at generation, check-in and signature events.</p> <p>The default naming convention is %:Name%_%action%_%templatename%_%timestamp%</p> <p>If this property is left blank, the system will use the default naming convention.</p> <p>The following attributes permitted when formulating a document naming convention are:</p> <ul style="list-style-type: none"> • %checkintype% • %action% • %templatename% • %user% • %timestamp% • Proposal attributes such as %:Name%. Note: any variable prefixed by ':' represents a field on the Proposal object. <p>Example proposal document name using the default naming convention: <i>SOW_Regenerated_SOW ABC_2015-08-07</i></p>
Document Structure FX2 For Imported Docs	<p>Check this box to make document structure FX2 format for all Offline documents (created or imported). If not checked, all offline documents are created in the "pre-existing" format.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> This property only applies to Offline agreements created from the Agreement or user Home page links in Salesforce. The format of Offline agreements created using X-Author for Contracts will still depend on user-input from X-Author.</p> </div>

Setting	Description
Email Template For Checkin Notification	Type the email template for sending check-in notifications.
Enable Clause Approvals	This check box allows you to set up approval processes on clauses used in your document.
Enable Document Versioning	<p>Check this box to enable Document Versioning. All new agreement records created in your org will use Document Versioning after this setting is enabled. Enable Version Control must be enabled for Document Versioning to work properly.</p> <p>Enabling Document Versioning changes the value of the Version Aware Agreement field to TRUE for all new agreements after the property is activated. The Version Aware field is a flag that tells Apttus Contract Management to use Document Versioning for a specific record.</p> <p>Important Note: It is recommended that once a record is flagged as Version Aware, you do not disable this field, as versioning will become undefined for the agreement record in question. Instead, ensure that records which should not use Document Versioning do not have the field enabled when they are created.</p> <p>For more information on how you can configure Document Versioning for your org, refer to Enabling Contract Document Versioning in <i>Contract Management Administrator Guide</i>.</p>
Enable Merge Call Debug	Enable Merge Service debugging.
Enable Multiple Checkout	Allows multiple checkout. This is applicable only when version control is in effect.
Enable PDF Security	Enabling PDF security lets users apply security settings to PDF documents and protect them with a password. See Enabling PDF Security for Quote/Proposal Documents for more information.
Enable Submit Merge Call	Submits merge calls for processing. A Submit button is displayed during document generation.

Setting	Description
Enable Template Versioning	<p>Check this box to enable Template Versioning. <i>All new Templates created in your org will use Template Versioning after this setting is enabled.</i></p> <p>For more information, refer to Template Versioning in <i>Contract Management Administrator Guide</i>.</p>
Enable Version Control	<p>Check this box to enforce a check-in/check-out policy for agreement documents. This setting must be enabled when "Enable Document Versioning" is checked. Note: This property existed in CLM versions prior to 8, so this property may already be enabled.</p>
Footer Datetime Format For Imported Docs	<p>Specify the format in which date and time will be shown in the generated agreement. When a new document is imported into the system, it will include the Date in the bottom left corner of the footer on each page, in the format selected above. To know the supported date and time formats for footer, refer to Setting date and time format for footer in <i>Contract Management Administrator Guide</i>.</p>
Instance URL	<p>The Salesforce instance url for redirecting to custom pages. For example: https://na7.salesforce.com</p> <p>This is required to navigate to custom pages in the managed package.</p>
Max Child Level	<p>The maximum level of lookups and child objects available from the parent object to generate the merge data for. For example, Agreement is the parent object, Agreement Fee is the child object of Agreement and Agreement Fee Adjustment is the child of Agreement Fee and grandchild of Agreement.</p>
Merge Call Timeout Millis	<p>The timeout in milliseconds for the merge request. Type a number to indicate timeout in milliseconds for the merge request. For example: 60,000</p>
Merge Webservice Endpoint	<p>Type the Apttus merge webservice endpoint. For example: https://mergeweb.apttus.net/cgi-bin/MergeServer/Bin/mmcgi.exe</p>
PDF Owner Password	<p>Type the password required to change permissions of the PDF document like printing or editing.</p>

Setting	Description
Publish Author Events	Indicates whether merge events that occur in X-Author, such as check-in or check-out, should be published. If enabled, a record is inserted in the Merge Event table on the Agreement record.
Publish Merge Events	Indicates whether merge events, such as generating an agreement document or creating offline document should be published. If enabled, a record is inserted in the Merge Event table on the Agreement record.
Sync Bundle Using Line Items	Synchronizes bundle products using agreement line items. The default uses agreement summary objects. This setting appears only if you have the Apttus Contract-Configuration Integration package installed.
Sync Option Products	Synchronizes options along with bundles. The default is to synchronize bundle only. This setting appears only if you have the Apttus Contract-Configuration Integration package installed.
Temp Email Template Inactive Hours	Use this property to set the orphan period of temporary email templates to use in conjunction with the CleanupJobScheduler APEX class. The default value of this property is set to 4 hours. For more information, refer to <i>Contract Management Administrator Guide</i> .
Use Agreement Locks for Versioning	Check this box to use Agreement locks for versioning instead of document-level locking: <ul style="list-style-type: none"> • If enabled, all agreement documents are locked (by the user checking out) when any one of them is checked out. • If disabled, only checked out documents are locked (by the user checking out)-any other agreement documents which have not yet been checked out can be checked out for editing.

Config Asset Pricing Criteria Fields

This custom setting holds the list of API names of fields from Asset Line Item object used in setting Asset Pricing Indicator. Criteria with a specific Line Status can also be defined. You can create multiple data sets as well.

Setting	Description
Criteria Field Names	Enter the list of API names of fields from the line item object used in setting the asset pricing indicator. Each field must be separated by a comma or a new line.
Line Status	<p>Enter the list of line statuses to make the criteria valid only for the line item with line status mentioned in this field. Examples of valid values are <i>Renewed, Amended</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> If you want to define a Line Status specific criteria, you must define two criteria: one with Line Status and another with blank Line Status for the same criteria fields.</p> </div>

Config Asset Pricing Default

This custom setting holds the default value for the asset pricing indicator associated with a line status. The value defined in the setting is only applicable on the line status defined. Create different data sets for different line statuses. Click **Manage** then click **New** to create a new record. Specify the exact value of line status in **Name**. Examples of valid values are *Renewed, Amended*. The list of valid line status values is defined in the Line Item object. Define the field mentioned in the table as desired and click **Save**.

Setting	Description
Default Asset Pricing Indicator?	Select this checkbox to enable asset pricing by default for Asset Related Line items associated with the given line status.

Config Custom Classes

This custom setting registers all custom classes that implement Callback classes for customization. Click **Manage** and click **Edit** next to *Config Custom Classes*. Enter API names of the custom classes that you created next to the Callback class you want to implement. The following table lists the Callback classes and the global interfaces the Callback class implements.

Callback Class	Interface
Action Callback Class	CustomClass.IActionCallback3
Action Invoker Callback Class	CustomClass.IActionInvokerCallback
Action Params Callback Class	CustomClass.IActionParamsCallback
Adjustment Line Item Callback Class	CustomClass.IAdjustmentLineItemCallback
Adjustment Spread Callback	CustomClass.IAdjustmentSpreadCallback
Advanced Approval Callback Class	CustomClass.IAdvancedApprovalCallback
Asset Line Item Callback	Class CustomClass.IAssetLineItemCallback3
Asset Renewal Custom Callback Class	CustomClass.IAssetRenewalCustomCallback
Bulk Loyalty Point Callback Class	CustomClass.IBulkLoyaltyPointCallback
Cart Approval Callback Class	CustomClass.ICartApprovalCallback2
Deal Optimizer Callback Class	CustomClass.IDealOptimizerCallback2
Display Action Callback Class	CustomClass.IDisplayActionCallback
Formula Callback Class	CustomClass.IFormulaCallback
Loyalty Cycle Callback Class	CustomClass.ILoyaltyCycleCallback
Loyalty Point Callback Class	CustomClass.ILoyaltyPointCallback
Metadata Callback Class	CustomClass.IMetadataCallback
Option Filter Callback Class	CustomClass.IOptionFilterCallback
Pricing Callback Class	CustomClass.IPricingCallback2
Pricing Extension Callback Class	CustomClass.IPricingExtensionCallback
Product Attribute Callback Class	CustomClass.IProductAttributeCallback
Product Filter Callback Class	CustomClass.IProductFilterCallback
Recommendation Callback Class	CustomClass.IRecommendationCallback
Related Pricing Callback Class	CustomClass.IRelatedPricingCallback

Callback Class	Interface
Revalidation Callback Class	CustomClass.IRevalidationCallback
Shipping Callback Class	CustomClass.IShippingCallback
Tax Callback Class	CustomClass.ITaxCallback
Validation Callback Class	CustomClass.IValidationCallback

Config Custom Display Actions

This custom setting holds information about custom actions displayed in, for example, Installed Products view, Cart view.

Setting	Description
Action Area	Enter a value to select the action display area. Valid values are Left, Right, Center, and More. The value <i>More</i> indicates that the action is displayed under More button.
Action Label Name	Enter the name of the custom label for the action.
Action Name	Enter the API name for the action.
Action Page	Enter the name of the custom action page. You can implement a custom action either as a Visualforce page or as a custom class.
Action Params	Enter the URL parameters for the action. You can pass multiple parameters by using the ampersand character to separate each parameter. Each parameter is expressed in the form param-name=param-value. For example, <code>templateName=XYZ&draft=true</code>
Action Style Class	Enter the style class name for the action.
Action Type	Enter the action type.
Always Display	Select this setting to display the action (grayed out) even when it is not enabled.
Behavior	Enter the behavior that the open page action takes.
Display As	Enter the action, task, or both to display the action on a page as action button or task.

Setting	Description
Display Type	Enter the action display type. Valid values are: <ul style="list-style-type: none"> • Cart Line Item • Asset Line Item
Flow	Enter the flow associated with the action.
Is Enabled	Select this setting to enable the action for the display.
Sequence	Enter a number for the action display sequence.

Config Custom Display Columns

This custom setting holds information about fields displayed in, for example, Installed Products view, Cart view.

Setting	Description
Display Type	Enter the column display type. Valid values are: <ul style="list-style-type: none"> • Cart LineItem • Installed Product
Field Name	Enter the field API name for the column.
Flow	Enter the flow associated with the column.
Header Style	Enter the style used to display the header of a column, which is used primarily for adding inline CSS styles.
Is Editable	Select this setting to enable column value to be edited.
Is Price Point	Select this setting to determine type of a line item for use in Cost & Profitability Price Waterfall. If you select the setting, item is a Price Point. If you deselect the setting, item is an Adjustment.
Is Sortable	Select this setting to enable column sorting.
Sequence	Enter a number for the column display sequence.
Style	Enter the style used to display the column, which is used primarily for adding inline CSS styles.

Setting	Description
Style Class	Enter the style classes that must be applied to dynamic columns.

Config Data Cache

Data Cache is used to store run time data that can be used as application cache.

Setting	Description
Data	Enter delimited data.
Is Last	Enter the last value indicator

Config Field Set

Config Field Set is used to store list of fields for special purpose.

Setting	Description
Data	Enter delimited data.
Is Last	Enter the last value indicator

Config Flow

This custom setting allows you to define a user interface flow for CPQ. You can use default pages available to you or create custom pages. Click **Manage** then click **New** to create a new flow. Define the field mentioned in the table as desired and click **Save**.

Setting	Description
Assets Page	Enter the name of the page you want to display as Asset page. Specify one of the following or create a custom page. <ul style="list-style-type: none"> • SelectInstalledProducts • SelectInstalledProductsEn
Cart Page	Enter the name of the page you want to display as Cart page. Specify one of the following or create a custom page. <ul style="list-style-type: none"> • CartView • CartDetailView

Setting	Description
Catalog Page	<p>Enter the name of the page you want to display as Catalog page. Specify one of the following or create a custom page.</p> <ul style="list-style-type: none"> • SelectConfigProducts • SelectConfigProductsFilterView
Option Page	<p>Enter the name of the page you want to display as Option page. Specify one of the following or create a custom page.</p> <ul style="list-style-type: none"> • ConfigureBundle • SelectConfigOptions • SelectConfigOptionsTabView • SelectConfigOptionsListView • SelectConfigOptionsTreeView • SelectConfigOptionsDetailView • SelectBundleOptions
Product Attribute Detail Page	<p>Enter the name of the page you want to display as Product Attribute Detail page. Specify one of the following or create a custom page.</p> <ul style="list-style-type: none"> • ProductAttributeDetail3

Config Select Options Settings

Configuration settings for option selection pages. The record should be named as "Primary Settings".

Setting	Description
Bundle Description Field	<p>Enter the field names from the product object to be displayed as bundle description.</p>
Enable Option Page Search	<p>Select this setting to allow option search on the bundle configuration page.</p> <p>This setting enables a search bar on the Bundle Configuration page. The setting allows the user to search for options, attributes, and sub-bundles on the Configuration page.</p>

Setting	Description
Hide Disabled Options	Select this setting to hide the options that are disabled by the exclusion rules. Such options will not be shown in the list of available options. Also, if all such disable options are under one option group, this group is also hidden on the configuration page.
Hide Price Column	Select this setting to hide the price information column from the options page. Be careful in hiding this critical information.
Listed Options Column 2	Enter the API name of the product field to be displayed in the listed options section. A valid value could be like ProductCode.
Listed Options Column 3	Enter the API name of the product field to be displayed in the listed options section. A valid value could be like ProductCode.
Main Section Ratio	Enter the ratio to divide the options page. The ratio of the main sections in the page must be separated by a colon. The default value is 0:70:30. This is applicable to the SelectConfigOptionsDetail and ConfigureBundle pages.
Max Inline Option Attributes	Specify the maximum number of inline option attributes to be displayed in the attribute group. The default value is 3.
Option Field In Summary	Enter the Option field to be displayed on right hand side of configuration page.
Show Bundle Detail	Select this setting to show bundle price and quantity fields on options pages.
Show Option Quantity	Select this setting to display the Quantity in the body of the options pages. This setting controls the SelectConfigOptionsDetailView and ConfigureBundle page.

Config Select Products Settings

Configuration settings for product selection pages. The record should be named as "Primary Settings".

Setting	Description
Always Display Leaf Products	Select this setting to load and display all leaf nodes for a specific category. These leaf nodes have products associated with them. With this setting, user needs to just click the main category or any sub category to load all sub-categories (and products) at one click.
Cache All Products	Select this setting to cache all products to avoid SOQL queries. This setting must be enabled when the number of product records is small. This is a Beta feature.
Carousel Category Level	Enter a number for the maximum depth allowed to be browsed in the Product Carousel. No value in this field allows infinite browse depth. A value of zero will restrict you to the root level.
Carousel Default Icon	Enter the Default Icon to be used for the categories in the Carousel.
Cart List Item Description Field	Enter the API field name of the Long Description field to be used in the Cart Detail View page.
Collapse All Leaf Option Groups	Select this setting to collapse all leaf option groups on the Config Options Detail View page.
Custom Action Label Name	Enter the name of the custom label for the action.
Custom Action Page	Enter the name of the custom action page.
Disable Add Another	Select this setting to disable user from adding multiple instances of the same product.
Disable Add To Cart for Option Products	Select this setting to hide Add to Cart and Configure buttons for the option products on catalog pages. This is a global setting to hide these buttons.
Disable Add To Cart On Click	Select this setting to disable the Add To Cart button on click until the server confirms addition of product.

Setting	Description
Disable Favorites	Select this setting to disable saving the favorite, favorites category, and other favorites related UI items.
Enable Category Filter	<p>Filters the categories based on search results and displays in the Narrow Your Search area on the left. For example, if the search result has products from only two categories, the Narrow Your Search section displays only those two categories.</p> <div data-bbox="679 703 1426 826" style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> You should always select Enable Category Filter when Hide Narrow Your Search is cleared.</p> </div>
Favorites Display Label	<p>Enter a name for the group of favorite configuration records. This label is displayed as a category name on the catalog page. If you do not specify any name, the system gives <i>Favorites</i> as the default name.</p> <div data-bbox="679 1050 1426 1805" style="border: 1px solid #e0e0e0; padding: 10px; margin-top: 10px;"> <p> Deprecated setting</p> <p>Favorites Display Label Settings has been deprecated. Now you need to rely on overriding custom labels for renaming 'Favorites' with your choices such as Quick Buys, Most Used, and so on etc.</p> <p>For example, if you want to use term "Quick Buy" for favorites, Apttus CPQ contains two custom labels whose values you must override.</p> <p>Go to Setup > Custom Labels.</p> <ul style="list-style-type: none"> • Favorites > Click "New Local Translations/ Overrides" > Choose Language as "English" > Write "Quick Buys" in translated value area. • SaveAsFavorite > Click "New Local Translations/Overrides" > Choose Language as "English" > Write "Save as Quick Buy" in translated value area. </div>
Favorites Icon Attachment Id	Enter the ID to the attachment of the Favorites icon.

Setting	Description
Favorites Upload Image	You can choose an image to upload for your group of favorite configuration category. This image is displayed under your favorites (as entered in Favorites Display Label) category on the catalog page. By default, no image is set
Hide Breadcrumb	Hides the breadcrumb navigation element.
Hide Cart Header	Select this to hide the Cart Header for selected pages.
Hide Compare Products	Disables the Compare Products feature in the catalog page.
Hide Configure Action	Hides the Configure action for a Product on the catalog page.
Hide Default Options In Description	Hides the default options listed below the product description.
Hide Help Me Choose	Indicates whether to hide the Guided Selling link. By default this is not selected and the system shows Guided Selling link on the Catalog page for the respective categories.
Hide Line Item Attribute Details	Hides the Line Item Details section on the Product Attribute Detail page.
Hide Listed Products Price Column	Hides the price information column in listed product section. By default, this is not selected.
Hide Narrow Your Search	Hides the Narrow Your Search section that displays the category tree on the left of the catalog page. This setting is deprecated for the New UI.
Hide Options in Quick Add Mode	Select this to hide option products in Quick Add mode
Hide Product Image	Hides the product image from the catalog page.
Hide Selected Product Charge Types	Select this to hide charge types for selected products from the tree view options page.
Hide Selected Products Column1	Hides the column that displays the product name.

Setting	Description
Hide Single Top Category	Hides the top category. This property is useful only when you have a single root category and want to have a cleaner look for all of its child categories, without the root category.
Listed Favorite Configurations Column1	Enter the API name of the favorite configuration field that you want to display on the catalog page for your favorite configuration records. You can enter a maximum of one API names. If you have a requirement of displaying one more field, use Listed Favorite Configurations Column 2 custom setting.
Listed Favorite Configurations Column2	Enter the API name of the favorite configuration field that you want to display on the catalog page for your favorite configuration records. You can enter a maximum of one API name.
Listed Products Column2	(optional) Type the API name of the product field to display in the listed products section. Example Value: ProductCode
Listed Products Column3	(optional) Type the API name of the product field to display in the listed products section. Example Value: ProductCode
Listed Products Default Icon	Enter the ID to the attachment of the default Product Icon used for the Listed Products.
Main Section Ratio	Type the ratio in which you want to divide the page. The ratio of the main sections in the page should be separated by a colon. The default value is 20:60:20. This is applicable to the <i>SelectConfigOptionsDetail</i> , <i>ConfigureBundle</i> , and <i>SelectBundleOptions</i> page. Note: Do not use the <i>SelectBundleOptions</i> page from your drop-down list, it is no longer supported.
Minimize Cart	Displays the cart icon and hides the cart sidebar on the right handside of the catalog page.
Order Status Fields	Type the name of the line item fields (separated by comma) that contains information about promotion, delivery info, shipping info, and more.
Product Cache Fields1	Enter the first list of custom fields required for product cache.

Setting	Description
Product Cache Fields2	Enter the second list of custom fields required for product cache.
Product Cache Fields3	Enter the third list of custom fields required for product cache.
Product Cache Fields4	Enter the fourth list of custom fields required for product cache.
Read Only Location	Makes the Location field read-only.
Save as Favorite Dialog Columns	Enter comma-separated API names of the columns that you want to display on the Save As My Favorite dialog box on the cart.
Search Query Limit	Type a value to set the limit for a search query. For faster product search, type a smaller number. The default is 1000.
Selected Products Column2	(optional) Type the API name of the line item field to display in the selected products section. Example Value: ProductId__r.ProductCode
Selected Products Column3	(optional) Type the API name of the line item field to display in the selected products section. Example Value: ProductId__r.ProductCode
Selected Products Column4	(optional) Type the API name of the line item field to display in the selected products section. Example Value: ProductId__r.ProductCode
Show Checkbox In Rule Dialog	Enables check box to select multiple products in the Inclusion Constraint Rules dialog at once, instead of adding the products individually using Add to Cart. This setting works for <i>Inclusion Rule</i> with Min/Max Match Rule as <i>Include Min/Max</i> .
Show Favorite as First Category	Select this setting to display favorites category on top in list of product categories.
Show Product Icon Cart Detail View	Displays the product icon on each line item in the Cart Detail View page. Note: This will disable the action item columns and show the actions under the product icon.

Setting	Description
Show Quantity Input	Displays the Quantity field on the catalog page.
Show Recommended Products Cart View	Displays the recommended products component in the Cart Detail View page.
Show Selected Product All Charges	Displays all the charge types for selected products in the tree view options page.
Show Selected Products in Config Options	Displays the Selected Products widget in the Config Options Detail View page.

Config System Properties

This custom setting holds the Configuration & Pricing System properties. The record *System Properties* should already exist. If not, create a record named *System Properties*. Click **Manage** then click **New** to create a new record. Define the fields mentioned in the table as desired and click **Save**.

Setting	Description
Actions Column Position	Enter the position of the actions column in the cart page. Valid values are: <ul style="list-style-type: none"> • Left • Right
Adhoc/Product Totaling Hierarchy	Enter the list of product fields that represent the product totaling hierarchy. Each product field API name should be separated by a new line. Only applicable when product based totaling is in effect. Select the custom setting Totaling Group Type .
Admin User	The admin user is the default owner of activities created by a user who is not allowed to be the owner, for example, Customer Portal user. Enter the admin user name as <first name>, <last name>.
Auto Execute Post-Pricing Step	Select this setting to enable CPQ to execute the post-pricing logic automatically after pricing. The setting is applicable only after the pricing logic is defined in the pricing extension callback.

Setting	Description
Auto Execute Pre-Pricing Step	Select this setting to enable CPQ to execute the pre-pricing logic automatically before pricing. The setting is applicable only before the pricing logic is defined in the pricing extension callback.
Auto Finalize On Cart Approval	Select this setting to automatically finalize the cart when it is approved and ready for finalization.
Auto Refresh Usage Tier	Select this setting to enable modifiable usage tiers to automatically re-calculate tier price upon PLI change.
Auto Sync On Cart Approval	Select this setting to automatically synchronize the cart when it is approved and ready for finalization.
Auto Update Category View	Select this setting to enable auto incremental updates to category view.
Base Product Relation Field	Enter the API name of the product field that associates a child product with the base product.
Bypass Sharing	Select this setting to enable apex code to bypass record sharing.
Bypass Shopping Cart	Select this setting to display the Update Price and Finalize buttons and hide the Go To Pricing button on all the new pages. On the configuration page, only the Go To Pricing button is disabled. You can still finalize the quote using the Mini cart.
Cart Edit Access Idle Timeout in Minutes	Enter a number to specify the number of minutes of idle time a configuration can be kept in edit mode.
Cart Theme	Cart Themes are deprecated. No changes are executed even if the values are defined in the setting.
Cascade Shared Attribute Updates	Select this setting to cascade the shared bundle attribute updates to options in the bundle. If this setting is not selected, the bundle attributes will initially be cascaded to options in the bundle, but subsequent changes in the bundle attribute will not be cascaded to option attributes.
Cleanup Invalid Rule Prompt	Select this setting to enable removal of line items prompted by currently invalid rules.

Setting	Description
Compute Totals In Separate Step	<p>Select this setting to enable CPQ to perform the totaling in a separate step or combine it with the base pricing step. This setting ensures that the totaling, which is dependent on the number of lines, should be done as a separate remoting call. This setting helps to avoid the CPU time limit issue to a large extent.</p>
Constraint Rule Execution Mode	<p>Enter the mode to perform the constraint rule execution on the client side or the server side. By default, no value is specified and the system assumes the value as <i>Server</i>.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • <i>Client</i> • <i>Server</i> <p>If you want to execute the constraint rules in a different mode for a different flow, mention your flow name and constraint rule Action Type in the following format:</p> <pre>{ "flowName1":{ "Inclusion":"client", "Exclusion":"server" }, "flowName2":{ "exclusion":"client" } }</pre> <p>This custom setting supports inclusion, exclusion, and validation rules on the client side as well as the server side.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> In a Service CPQ flow, always execute constraint rules in Client mode.</p> </div>
CSS Override	<p>Enter the name of the static resource to override CSS in the catalog, attributes, options, and cart pages.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> To define CSS for a specific flow, define the field in the dataset of that flow and leave the field blank in System Properties. If you define the CSS Override in both the datasets, only the value in System Properties is considered.</p> </div>

Setting	Description
Currency Field Precision	<p>Enter a number to specify decimal places for currency precision. The default currency precision is 2 decimal places.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Currency Field Precision only applies to Net Price, irrespective of the currency. You can create a formula field to define the precision of the values of the amount fields based on different currencies.</p> </div>
Custom Asset Action Label Name	Enter a label name for a custom asset action.
Custom Asset Action Page	Enter the Visualforce name for the custom asset action page.
Custom Deal Guidance Page	Enter the name of the custom Deal Guidance page.
Custom Option Attribute Page	Enter the name of the custom Option Attribute page.
Custom Pre-Pricing Fields	Enter the list of custom fields from the line item object that determine the pre-pricing indicator.
Custom Pricing fields	Enter the custom field API name from the line item object displayed on the cart page. To add more than one field name, separate the names by a new line or a comma. When you makes any changes to these custom fields, the system is set to reprice before clicking Review and Finalize .
Default Asset Pricing Indicator?	Select this setting to make asset pricing default for Asset Related Line Items.
Default Catalog Page	<p>Enter the Visualforce page name for the default catalog page.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> • SelectConfigProducts • SelectConfigProductsFilterView
Defer Constraint on Option Selection	Select this setting to process the constraint rules on option selection on the Configuration Page. If the selected the constraint rules deferred until the Sales Rep clicks Go to Pricing or any other action button available on the Configuration page.

Setting	Description
Defer Pricing	Select this setting to price the products before displaying the cart or after displaying the cart. The default is true (defer until cart is displayed). The user can see the Update Price button on the Configuration page only if you enable the Defer Pricing setting.
Defer Validation Check in Bundles	Select this setting to defer the validation check in the bundle configuration step. This setting is selected by default.
Direct Configure Asset Actions	Select this setting to open the options page for the first bundle product that is configurable. The rest of the bundle products are added to the cart and displayed under the Selected Products section on the right-hand side panel. If the bundle product is set as <i>Must Configure</i> , an exclamation icon is displayed for incomplete configuration.
Disable Charge Type Totaling	Select this setting to disable the totaling of charge types.
Disable Constraint Rules	Select this setting to disable constraint rules. This may be used to optimize performance when constraints are not used in the organization. The default value is false (enabled).
Disable Existing Asset Pricing	Select this setting to disable the existing asset pricing. If disabled, prices of existing assets are not rolled up.
Disable Pricing Query Optimization	Select this setting to disable pricing query optimization for the cart. This setting allows the system to load a large number of managed fields from the line item into the cache. By default, fewer fields are retrieved for line items in the cart to optimize the heap. This indicator is used to disable the optimization so that it supports the existing customization.
Disable SOSL Text Search	Select this setting to disable the SOSL catalog search. When disabled, Apttus CPQ uses SOQL catalog search.
Display Cart Actions As Dropdown	Select this setting to display the line item action buttons as a drop-down menu on the cart page.

Setting	Description
Enable Adjustment Buckets	Select this setting to enable adjustments applied in the Mass Adjustments dialog box for a line item to be grouped in buckets, to be used as targets for applying further adjustments. This setting works only if you have set a finite value in the Max Adjustment Lines custom setting.
Enable Adjustment Spread	Select this setting to enable the adjustment on a bundle to spread to its options.
Enable Aggregate Pricing	Select this setting to enable aggregate pricing. This may be used to optimize performance when aggregate price rules are not used in the organization. The default value is false (disabled).
Enable Auto Reprice	<p>Select this setting to automatically reprice the cart when a price component is modified, without applying any pricing rules.</p> <p>This setting provides client-side computation facility.</p> <ul style="list-style-type: none"> • On Cart Grid with custom setting Enable Auto Reprice set to ON, when you change any Quantity on cart line item and click Reprice, Apttus CPQ updates the pricing fields such as Extended Price, Net Price for the specific row. • Calculates totals (by charges and frequency) and grand totals • Calculates subtotals for category <p>As a sales rep you can see estimated pricing without any delay using this setting.</p> <p>Estimated pricing means when quantity is changed and adjustment or discounts are provided, pricing calculation is done at the client side.</p>
Enable Auto Sequencing For Options	Select this setting to enable auto sequencing for options. If you do not select this option, the Option Item Sequence in the shopping cart and the Line Items is based on the user selection sequence rather than the Bundle Options sequence.
Enable Base Price Adjustment	Select this setting to enable unit level price adjustment for the Base Price of the product in the cart.

Setting	Description
Enable Base Price Rounding	Select this setting to enable CPQ to round list price and base price fields in the line item using the currency field precision setting.
Enable CartLocking for Concurrent Access	Select this setting to enable your cart for concurrent access to other sales representatives. Refer to Cart Locking for more details.
Enable Contextual Totals	Select this setting to display subtotals and totals section at the bottom of the cart page for Cart Grid UI. By default, this setting is not selected.
Enable Custom Rounding	<p>Select this setting to enable rounding of selling term and price in each price calculation step.</p> <ul style="list-style-type: none"> • Rounding of Selling Term: This setting considers the precision of selling term defined in the Term Field Precision setting and rounds the selling term consistently both on the UI and in backend calculation. • Rounding of Pricing: This setting rounds the price in each price calculation step considering the precision defined for each currency, both on the UI and in backend calculations. The amount in price calculation steps (for list price, base price, adjusted price, and net price only after each step such as price matrix, price ruleset, line level manual adjustment, group adjustment) is calculated considering the precision of the currency. <div data-bbox="655 1391 1426 1554" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Price rounding at backend occurs only for the base price, adjusted price, and net price when this setting is enabled.</p> </div>
Enable Defaulting For Products	Select this setting to enable defaulting for products. This may be used to optimize performance when product default rules are not used in the organization. The default value is false (disabled).
Enable Default Quantity For ABO Item	<p>Select this setting to enable the default quantity rules for ABO items.</p> <p>When you enable this setting, CPQ supports only attribute-based default quantity during ABO operations.</p>

Setting	Description
Enable External Pricing	Select this setting to enable external pricing. The default value is false (disabled).
Enable Fast Cloning	Select this setting to enable fast cloning.
Enable Field Expressions	Select this setting to enable users to use Expression Builder for attributes, option groups, and options.
Enable File	Select this setting to enable use of Files. It is mandatory to Run the Migration after making it true.
Enable Keyed Matrix Pricing	Select this if you have option products with a large number of dimensions of type discrete. This also helps in reducing SOQL queries.
Enable Location	Select this setting to enable users to select a location for a cart. The line items will have the current cart location assigned to them.
Enable Matrix Pricing For Options	Select this setting to enable matrix pricing for options. This may be used to optimize performance when options do not use price matrices in the organization. The default value is false (disabled).
Enable Notification Feed	Select this setting to enable notification pop-ups. <div data-bbox="655 1290 1426 1496" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Only applicable for Quote Collaboration notifications. The notification pop-up appears when any collaboration request is submitted, completed, accepted and merged in the parent cart.</p> </div>
Enable Optional Items	Select this setting to enable optional items in the cart.
Enable Paginated Grid	Select this setting to enable pagination for cart grid.

Setting	Description
Enable Price Matrix Audit Trail	<p>Select this setting to enable CPQ to create audit trail entries when adjustments are applied on the Line Item through Price Matrices. The audit trail entries are created on the Adjustment Line Item object.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> This feature does not work if you use adjustment buckets.</p> </div>
Enable Price Rule Audit Trail	<p>Select this setting to enable CPQ to create audit trail entries when promotions are applied on the Line Item through Price Rules. The audit trails entries are created on the Adjustment Line Item object.</p>
Enable Total Level Incentive	<p>Select this setting to enable incentives at the total level.</p>
Enhanced Search URL	<p>Select this setting to enhance search URL endpoint.</p>
Expand Bundles in Cart	<p>Select this setting to expand all attributes and options of a bundle product in the cart.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Pagination feature is not supported along with Expand Bundles in Cart.</p> </div>
FavoriteFilters	<p>Enter the API names of fields of type picklist and multi-select picklist from favorite configuration object. These fields define the filters that can be used to categorize favorite configuration on catalog page. If you define default values for the picklists, they are displayed on the catalog page as well. Only the first five fields are displayed on the catalog page. Enter the API Names of the fields separated by a comma or by a new line.</p>
Field Expression Execution Mode	<p>Indicates where the numeric expressions are evaluated. Following are the values:</p> <ul style="list-style-type: none"> • Server - (Default) Enables the server-side execution of the numeric expressions. • Client - Disables the server-side execution of the numeric expressions.

Setting	Description
Fixed Button Bar	Select this setting to display a fixed bar for actions button on the catalog, attributes, options, cart, and installed products page.
Generate Relative Url For Sites	Select this setting to enable CPQ to generate relative URL for links for a Communities user. This custom setting is deprecated.
GroupBy Fields	Specify the API names of those line item fields that are of the type: Lookup, Formula Fields, and Text. These line item fields are shown under the Group By drop down on the cart page. For example, for Group By PriceList, specify the API name of the field that is a lookup to the pricelist object. These fields are also used in the new Cart View feature available under Viewing the Cart in Grid View section in the User Guide. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> API names with relationship fields are not supported. For example, <i>Apttus_Config2_Productldr.name</i> is not supported. However, the regular Line Item Field API Names like <i>Apttus_Config2Productld_c</i> are supported</p> </div>
Guide Page Default	Enter the Visualforce page name for the default guide page for product selection.
Hide Asset Actions	Enter the actions to hide on the Installed Products page. Use a comma to separate values. For example, Increment, Amend, Renew, Cancel. These actions are tied with your Flow settings. Refer to Permitted Actions for Assets for more details.
Hide Cart Views	Select this setting to hide Cart Views on the cart.
Hide Cart Views Creation	Select this setting to hide the Create New View menu option in the Cart View.
Hide Copy Action	Select this setting to hide the copy action in the cart. The default value is false (copy icon is displayed).

Setting	Description
Hide Dates For One Time Charge	Select this setting to hide the dates for price list items of type One-Time Charge.
Hide Evergreen End Date	Select this setting to hide the end date for Evergreen Proposals.
Hide Grand Total	Select this setting to hide the grand total line on the cart page.
Hide Resolve Config Link	Select this setting to hide the link to the resolve configuration error page and instead display the error along with the constraint rule message.
Hide Subtotals In Cart	Select this setting to hide subtotals in the cart view. The default value is false (show subtotals in the cart). When selected, the system hides subtotal lines in the Summary section and still shows Category Total, One Time Total, and Grand Total.
Instance Url	Enter the Salesforce instance URL (for example, https://na7.salesforce.com). The instance URL is required to navigate to custom pages in the managed package.
Keep Abandoned Carts	Select this setting to keep abandoned carts. The default value is false (abandoned carts are moved to the recycle bin).
Large Cart Spilt Criteria Fields	This setting is not functional. You must use the Split Cart Criteria Fields setting to define criteria for the Large Cart flow.
Large Cart Threshold	This setting is not functional. You must use the Split Cart Threshold setting to define criteria for the Large Cart flow.
Max Adjustment Lines	Enter the maximum number of discount lines allowed for a line item.

Setting	Description
Max Allowed Lines For Mass Actions	Enter the maximum number of line items to be selected for mass actions on the cart. The default value for selecting the line items for mass action is 10. Max Allowed Lines For Mass Actions custom setting is overridden when Perform Mass Actions in Parallel custom setting is enabled by the user for selecting a large number of line items on the cart for mass action in one go.
Max Constraint Rules Round Trip	Enter the maximum number of round trips after which the constraint rule processing should stop. Round trip happens only when auto included products trigger more rules. The default value is 3.
Misc Charge Types	Enter the list of miscellaneous charge types. Each charge type should be separated by a new line. The charge types are displayed as picklist values when adding miscellaneous items to the cart. The default values are <i>Sales Tax and Shipping & Handling</i> .
Multi Currency Management	Enter a value to define the currency precision in a multi-currency org. Valid values are <i>Platform</i> and <i>None</i> . <ul style="list-style-type: none"> • <i>Apttus</i>: This is the default value. If you choose this value, the system considers the currency precision settings that you have defined using Currency Field Precision. • <i>Platform</i>: If you choose this value, the system considers the precision settings for the currency defined at Setup > Administer > Company Profile > Manage Currencies. When you click Manage Currencies, the decimal places defined for your Corporate currency is considered. If you do not specify any value in the Decimal Places, the system considers the default value as 2.
Option Line Item Columns	Enter the field name from the line item object displayed in the Option Hierarchy page. To add more than one field name separate the names by a new line or a comma.
Option Pricing Chunk Size	Enter a number for the the option pricing chunk size for bundles with a large number of options. The default value is 100. The SFDC governor limit affects the chunk size.

Setting	Description
Option Product Columns	Enter the field name from the product object displayed in the Option Hierarchy page. To add more than one field name separate the names by a new line or a comma.
Options Page	<p>Enter the Visualforce page name for default options page. If no value is specified, the options page defaults to the icon view. Valid values are:</p> <ul style="list-style-type: none"> • SelectConfigOptions • SelectConfigOptionsTabView • SelectConfigOptionsListView
Percentage Field Precision	Enter a number to specify decimal places for percentage precision. The default percentage precision is 2 decimal places.
Perform Mass Actions in Parallel	Select this setting to perform mass actions on the cart. You can copy and remove multiple line items from the cart by mass action in one go.
Populate Attribute Extensions	<p>Select this setting to indicate that the attribute values are populated in the attribute extension objects.</p> <div data-bbox="655 1149 1426 1272" style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> In Summer 2020, do not use this setting, which is added in preparation of a future functionality.</p> </div>
Pricing Batch Size	<p>Enter a number to define the number of line items that can be processed in a single pricing call. Setting the Pricing Batch Size, the system runs pricing with the specified number of products as a batch, thus increasing performance. These batch calls to the database are governed by the Salesforce CPU time limit and hence the number assigned for Pricing Batch Size must be carefully evaluated.</p> <div data-bbox="655 1617 1426 1780" style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> You can configure this setting based on a flow. In such a case, the flow-based setting overrides the generic setting.</p> </div>

Setting	Description
Pricing Profile	<p>Enter <i>Basic</i>, <i>Advanced</i>, or <i>External</i>. A pricing profile is <i>Basic</i>, when there are none of the following used:</p> <ul style="list-style-type: none"> • Pricing Rules • Price Matrices • Related Pricing Setup • Bundles <p>If the Pricing Profile field is left blank, the default value is <i>Advanced</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> You can configure this setting based on a flow. In such a case, the flow-based setting overrides the generic setting.</p> </div>
Product Attribute Detail Page	Type the Visualforce page name for default attributes page. This is the custom page to capture product attribute details.
Product Attribute Extension Tables	Enter comma-separated API names of the lookup relationships, created with the Product Attribute Value object. For example, if you have 4 extension objects to Product Attribute Value object and their corresponding 4 lookup relationships, you must specify 4 API names in this field.
Product Display Max Length	Enter the maximum number of characters to be displayed for the product name on the cart page. If the product name exceeds the maximum length, the ellipsis is shown. The default value is 21.
Product Option Price Order	<p>Enter the order of execution of option pricing (with adjustments) in conjunction with the price rule set and matrices. The valid values are: <i>First</i> and <i>Last</i>. By default, the value is <i>Last</i>.</p> <ul style="list-style-type: none"> • <i>First</i> - The system applies the adjustments before the price rulesets and after price matrices. • <i>Last</i> (Default) - The system applies the adjustments after the price rulesets.

Setting	Description
Product Sorting Fields	Enter the list of API names of fields from the Product object to be displayed in the sorting drop-down on the Catalog page. The Sales rep can use the Sort drop-down to select a field from the list to sort the products on the Catalog page.
Quantity Field Precision	Enter a number to specify decimal places for quantity precision. The default quantity precision is 2 decimal places.
Refine Search Checkbox Display Limit	Enter a number to specify the limit after which the Refine Your Search options are displayed as a picklist. By default the options are displayed as checkboxes. The minimum and the maximum values are 0 and 20 respectively. Any number less than 0 is considered 0 and any number greater than 20 is considered 20.
Related Price Scope	<p>Enter a value to perform the related pricing calculations over the entire cart or confine the calculations to a Bundle product only. For example, if the price of an Option product is a percentage of another Option product in the same bundle, consider the following scenarios with Related Price Scope = <i>Cart</i> and <i>Bundle</i>,</p> <ul style="list-style-type: none"> • If value = <i>Cart</i>, the Option price is based on the price of all the instances of the related product in the cart, whether it is in the same Bundle or a Standalone or in an another Bundle. • If value = <i>Bundle</i>, the Option price is based on the related product instances within the same Bundle.
Remove Invalid Rule Products	Select this setting to automatically remove line items auto-included by invalid rules on cart launch. If the setting is disabled, the user is prompted to take appropriate action.
Resolve Configuration Page	<p>Enter the default Resolve Configure page name. On Resolve Configuration Errors/Warnings, this page is used.</p> <ul style="list-style-type: none"> • <i>ResolveConfig</i> • <i>ResolveConfigProducts</i>
Revalidation Product Columns	Type the API names of product object fields that you want to display on the revalidation pop-up on the cart page. You can separate each field API name either by a comma or by a new line.

Setting	Description
Rounding Mode	<p>Enables currency rounding in pricing calculations. This setting rounds adjustments before calculating the base price. Enter one of the following values:</p> <ul style="list-style-type: none"> • UP: Rounds the currency to the next number. For example, 21.2 is rounded to 22. • DOWN: Rounds the currency to the previous number. For example, 21.8 is rounded to 21. • HALF_UP: Rounds the currency to the next number if the decimal is equal to or greater than 5. For example, 21.5 to 21.9 is rounded to 22. • HALF_DOWN: Rounds the currency to the previous number if the decimal is equal to or smaller than 5. For example, 21.1 to 21.5 is rounded to 22. • HALF_EVEN: Rounds the currency to the nearest even number. For example, 23.5 is rounded to 24 and 22.5 is rounded to 22.
Run Misc Finalization Task in Async Mode	<p>Indicator to check whether proposal line product attribute and usage tier records to be created with some delay after you Finalize a cart. In a scenario when the user creates Asset or generates a document immediately after finalizing the cart, there are chances that the record does not have attribute value or usage tiers.</p> <p>If this checkbox is selected, the usage tiers and attribute record for proposal line items are created in Async mode when you finalize a cart. Otherwise, the usage tiers and attribute record for proposal line items are created as soon as you finalize a cart.</p>
Run Post Finalize Trigger In Async Mode	Indicates whether the finalization task should be run asynchronously.

Setting	Description
Same Day Cancellation	<p>Select this option if you want the Asset Cancellation applicable on the same day. For example, while performing Termination on an Asset you enter the Termination Date as 5/11/2016. If you select Same Day Cancellation, the cancellation will be effective from 5/11/2016. Otherwise, the cancellation will be in effect a day later which is 5/12/2016.</p> <p>Same Day Cancellation is applicable by default. Clear the checkbox to apply cancellations after a day.</p>
Save On All Actions	<p>Saves the configuration when you click any action on the cart page.</p>
Search Category Default	<p>The default search category. Indicates the category to default to when searching for products using the search text box in the product selection page.</p> <p>The valid values are the following:</p> <p><i>All Categories All Products</i></p> <p>The default value is <i>All Categories</i>. Choose <i>All Products</i> to search all products regardless of categories.</p>
Selling Term Calculation Method	<p>Indicates the method to calculate the selling term for Line Items on the Cart page.</p> <p>The valid values are:</p> <ul style="list-style-type: none"> • Calendar: The selling term is calculated based on the calendar. This is the default method. • Billing Preference: The selling term is calculated based on the Billing Preference. You can price the transactions based on the term calculated according to the user's preferred start day instead of it always being the first of the month. <p>When the Billing Management package is installed and the Selling Term Calculation Method setting is set to Billing Preference, the selling term is calculated based on the billing preferences. For more information, refer to "Billing Preferences" in <i>Billing Management on Salesforce Administrator Guide</i>.</p>

Setting	Description
Service Line Split Criteria	Defines the criteria to clone the service line.
Service Price Distribution Method	<p>Enter the value as follows:</p> <ul style="list-style-type: none"> • Rollup: Considers all entries of asset components and service line items and the rolls up the final value. • Allocate: If values for different services are different and you click Relate and add another option, it will take the price of the matrix entry, it will then distribute to entire service price.
Show Admin Sidebar	<p>Hides the sidebar for the following Admin pages:</p> <ul style="list-style-type: none"> • CPQConsole.page • CategoryManager.page • ClassificationHierarchy.page • ConstraintRuleActionCriteriaEdit.page • ConstraintRuleConditionCriteriaEdit.page • CriteriaUpdate.page • DisplayActionSettings.page • DisplayColumnSettings.page • FeatureSet.page • HierarchyViewUpdate2.page • IconUploader.page • ManageGuidedSearchRule.page • MultipleConstraintRulesAdmin.page • PriceListItem.page • PriceRule.page • ProductConsole.page • ProductConstraintView.page • ProductDefaultRuleCriteriaEdit.page • ProductFilterMaintenance.page • RelateAttributeToProduct.page • RelateFeatureToProduct.page • RelateProductToBundle.page • RelateProductToCategory.page • RelateProductToFootnote.page • SystemProperties.page
Show Attributes in Cart	Shows the specified attributes applicable to the line items in the cart. Attributes appear in the product dialog.

Setting	Description
Show Header	Displays the header tabs and the sidebar on the custom pages.
Show Info In Header	Indicates whether to show information message from auto include or auto-exclude in the header. The default value is false (Hide).
Show Radio Buttons for Asset	Enable to display radio buttons for asset actions Renew, Increment, Amend, and Cancel.
Show Tab View	Displays option groups as tabs instead of sections in the options page. You can enable the Show Tab View setting at a product level also. Select the checkbox on the product details page.
Skip Constraint Decision Field	Indicates that fields on the line item skips the Constraint Rule check. Enables bypassing constraint and finalize quote even if there are constraint error.
Skip Review	Skips the review step for items in the cart.
Split Cart Criteria Fields	Defines the criteria to break the summarized view of items added during a large cart process. List the API names of the line item fields separated by a comma or new line. Enter the field names whose values do not change after the records are created for a cart.
Split Cart Threshold	Indicates the number of line items, when exceeded a cart is created. When you define the threshold as 20 and the cart has 30 line items, a cart is created for the remaining 10 line items.
Static Criteria Fields	Defines the criteria to break the summarized view of items added during a large cart process. List the API names of the line item fields separated by a comma or a new line. Type the field names whose value does not change after the records are created for a cart.

Setting	Description
Term Field Precision	Type the precision value that you want to display for the Selling Term column on the shopping cart. For example, if your term calculation results to 4.553412 and you have set Term Field Precision to 3, the Selling Term column displays 4.553. The default term precision is 5 decimals. This setting is applicable only for the New UI.
Totaling Group Type	The totaling group preference. The valid values are the following: <ul style="list-style-type: none"> • <i>Category</i>: When you add a product to the cart from the lowest leaf category where it is associated, the Category Hierarchy column in the Line Items related list is populated with its bread-crum trail. This is useful to identify the exact category from where the product was added, in case if the product is associated with multiple categories • <i>Product</i> The default value is <i>Category</i> . For Product-based totaling, the Product Totaling Hierarchy setting is required.
Update View Category Batch Size	Defines the number of categories to update views in a single transaction. Enter a number to define the batch size.
Update View Product Batch Size	Defines the size of the batch to update views of products in a single transaction. Enter a number to define the batch size.
Update View Use Dml Limit	Indicates whether the DML limit is used to determine the workload of a batch to update views of products.
Use Button to Save Selection	Indicates whether to wait for button click before processing option selection and validation.
Use Enhanced CSS	Enables you to include the enhanced CSS file on CPQ pages.
View Cart Custom Fields	Enter the list of custom fields from the line item object displayed in the custom view cart page. Each field API name should be separated by a new line or a comma.

Setting	Description
View Cart Custom Fields 2	Enter the list of additional custom fields from the line item object displayed in the custom view cart page. Each field API name should be separated by a new line or a comma.
View Cart Page	Type the Visualforce page name for default cart page.
View Cart Total Custom Fields	Enter the list of custom fields from the summary group object displayed in the custom view cart page. Each field API name should be separated by a new line or a comma.

When a line item of **Charge Type** = *One Time* or a proposal that is *Evergreen* is created, you can choose to hide the dates of the line item or in the proposal. Similarly, if the Line Item has **Auto Renewal** marked as *true*, you can choose to hide the dates on those line items.

The behavior listed below is true when you split the bundle ramps.

Scenario	Flags selected	Result
If Price Type is <i>One Time</i> on Line Item	Hide Dates For One Time (If selected)	Hide Start Date and End Date on Line Item.
	Hide Dates For One Time (If not selected)	Start Date and End Date are visible.
If Price Type is <i>Recurring</i> or <i>Usage</i>	Hide Evergreen End Date (If selected) and AutoRenewalType = Evergreen on Line Item	End Date is hidden.
	Hide Evergreen End Date (If not selected) and AutoRenewalType = Evergreen on Line Item	End Date should behave the same way it behaves for recurring.

Config User Preferences

This custom setting holds Configuration and Pricing user preferences.

Setting	Description
Catalog Products Per Page	Enter the number of catalog products that you want to display on the Catalog page. Valid values are: 10, 20, 50, and 100.
Category Preference	Enter the Category preferences for the user or profile. Enter the list of category names separated by comma.

Setting	Description
Collapse Error Message	Select this setting to collapse error messages.
Collapse Info Message	Select this setting to collapse info messages.
Collapse Quick Add Filter	Select this setting to collapse the quick add filter by default.
Collapse Warning Message	Select this setting to collapse warning messages.
Flow	Enter the name of the default flow associated with the user.
Groups Per Page	Number -
Items Per Page	Enter the number of browsed or searched products to show on the product selection page. Valid values are: 5, 10, 15, 20, and 25.
Logging Level	Enter the logging level for JavaScript code. Valid values are: Debug, Info, and Error.
Option Items Per Page	Enter the number of displayed option products to show in the cart page. Valid values are 5, 10, 15, 20, and 25.
Selected Comparison Products	Enter values to maintain selection of compared products, between the Catalog and the Compare Features page.
Selected Products Per Page	Enter the number of selected products that you want to display on the configuration pages. Valid values are 5, 10, 15, 20, and 25.

Installed Products Settings

Custom Settings for the Installed Products Page in Apttus CPQ.

Setting	Description
Account Hierarchy Batch Size	Enter the number of Account Hierarchy records processed for each batch execution. Recommended value is 500. Valid values range from 1 to 2000.

Setting	Description
Allow Backdated Termination	<p>This setting is disabled by default, that means, user cannot terminate an asset by specifying an end date to any date prior to the current date. End date should be greater than the start date.</p> <p>Select this setting to enable user to specify a termination date earlier than today. This may have additional impact on billing because an invoice for the period may have already been generated.</p>
Allow Mass Change	<p>Select this setting to enable user to perform mass changes for <i>must configure</i> assets.</p>
Amend Change Fields	<p>Enter comma separated line item field names whose values can turn an existing asset line into an amended asset line. This setting is no longer used. All the editable fields honor the flow settings configured for the Cart.</p>
Apply Adj To Current Contract Term	<p>Select this setting to keep the discounting limited to the current contract term.</p> <p>When you enable this setting, CPQ applies adjustments and calculates the net price and net unit price of the assets based on the current contract term only. When you disable this setting, CPQ applies adjustments and calculates the net price and net unit price of the assets based on the original start date of the asset.</p>
Asset Currency Field Precision	<p>Enter the number of decimal places for the asset currency fields. (used by the <code>formatfields</code> function)</p>

Setting	Description
Asset Source	<p>Enter the account source which the asset line items will be retrieved from.</p> <p>This setting allows you to filter the assets to be displayed on the Installed Products page based on the Ship To or Sold To or Bill To fields of an account. By default, all the assets filtered with the Sold To field are displayed. Specify the API name of the Account field that you want to use as a source for displaying assets. For example, to filter the assets based on Ship To field, enter <code>Apttus_Config2__ShipToAccountId__c</code>. You can specify all the three account fields and the system considers an OR condition between these fields while filtering. This is useful when an account has different locations for shipping and billing and you want to display only those assets that have been shipped to a certain location.</p>
Asset Termination Fields	<div style="border: 1px solid red; padding: 10px;"> <p> Do not use this setting. Instead use the <i>Asset Termination</i> option from the Display Type picklist. For more information, see Configuring Display Columns Settings.</p> </div>

Setting	Description
Base Price Defaulting Method For Renewal	<p>Enter a value to define how CPQ must default the base price when an asset is renewed. Valid Values are:</p> <ul style="list-style-type: none"> • Net Unit Price (default if not specified): CPQ renews the asset line with the net unit price. If no value is specified for this setting, this is the default behavior of CPQ during renewal. • Higher Of Contract Unit Price / Net Unit Price: CPQ renews the asset with the higher value of contract unit price of net unit price of the asset. • Lower Of Contract Unit Price / Net Unit Price: CPQ renews the asset with the lower value of contract unit price of net unit price of the asset. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Other asset operations still use the net unit price for loading the asset line items. CPQ applies this setting to bundle and its options similarly (that means, a bundle cannot have a higher price while its options have a lower price). You can define this setting at a flow level; however, the flow-level setting overrides the setting defined at Primary Settings.</p> </div>
Create Renewal Opportunity	<p>Select this setting to enable CPQ to create a renewal opportunity for system generated asset renewal quotes.</p> <p>This setting indicates if you want to create renewal opportunities along with renewal quotes. By default, this check box is not selected. This is to prevent the system from running into locking issues when an account has a large number of assets and the batch process creates the renewal opportunities for all these assets.</p> <p>When this setting is true, the Create Renewal Opportunity scheduled job runs and creates the renewal opportunities along with renewal quotes.</p> <p>When this setting is false, the Create Renewal Opportunity scheduled job runs and does not create the renewal opportunities and creates only the renewal quote.</p>
Default Cotermination Option	Enter the default end date preference for Cotermination.

Setting	Description
Default Renewal Price List	Enter the name of the Price List which is a mandatory field for Quote creation.
Default Renewal Term	Enter a value for a renewal term. When the value is provided use this value as the renewal term for Renewing products. The value here denotes months to renew as the end date. Ideally, your <i>Selling Term</i> is equal to your <i>Default Renewal Term</i> .
Editable Fields for Cancelled Lines	<p>Enter comma-separated API names of the fields that you want to make editable for cancelled lines on the cart (during asset termination).</p> <p>You can enter a custom currency field that is not based on a formula. You cannot enter out-of-the-box currency fields such as base price and base extended price as editable fields.</p>
Enable One Time Change	<p>Select this setting to enable modifications or amendment to one-time assets. This is a global setting and cannot be restricted to apply for specific products. You can perform only amendments on one-time assets and not renewals.</p> <p>If you deselect this and modify the asset, the renewal quote is updated for the modified asset. If you set it to false, Renewal Opportunity and Renewal Quote are not created for the one-time only products, but if you modify the asset, the change is reflected in the Renewal Quote.</p> <p>If you set it to true, Renewal Opportunity and Renewal Quote is not created for one time.</p> <p>It is recommended that you treat one-time assets purely as one-time sales. Any modifications or renewals should not be encouraged for one-time assets.</p>
End Date preferences for Cotermination	<p>Enter comma separated values (without space) to enable the user to select one of the following end dates while coterminating incremental licenses.</p> <ul style="list-style-type: none"> • RetainCurrentAssetEndDate • UseCustomDate • UseProposalEndDate

Setting	Description
Filter Fields	Enter the API name of Asset Line Fields to be displayed on the Filter By panel. Works with text fields, Picklist, Multi-picklist, Date, DateTime and Boolean. Commonly used fields are Start Date, End Date, Lead Time Expiration, and Asset Status . Usually, all fields under Asset Line Item object are supported but you must enter <i>ExpirationLeadTimeInDays</i> value in order to display Lead Time Expiration field in the Search pane.
Hide Co-Term	Select this setting to hide the co-term end date on renew. This setting hides the Coterminate with Increment panel on the Change Quantity (Increment Asset) page. The Coterminate with Increment panel is displayed by default.
Max Renewal Group Per Job	Enter the number of Max Renewal Groups processed by one batch job. This setting is used to limit the length of batch job to avoid too many running batch jobs.
Max Renewal Line Item Per Cart	Enter the number of Max Renewal Line Items to be processed in one cart. This setting is used to limit the size of product configuration to avoid exceeding CPU and SOQL limits.
Max Renewals Per Trip	Enter the maximum number of renewals per trip. To prevent CPU timeout use a smaller number. The default is 20.
Merge Action Criteria Fields	Enter comma-separated asset line item fields that must be common among the asset line items to be merged. The default fields are product, selling term, charge type, and end date.

Setting	Description
Purchase Identification Criteria	<p>Enter comma separated asset line item fields that determine the eligibility for cotermination and quantity cumulation.</p> <p>This setting allows user to define a criteria to get coterminate related asset lines in the Coternimate with Increment section on the Change Quantity page during asset increment. The default purchase identification criteria are: Product, Charge Type, Option, and Account. CPQ currently supports only Purchase Identifier and alphanumeric custom fields.</p> <p>For example, if you select Purchase Identifier, during increment of a selected asset, all other assets with the same Purchase Identifier are displayed on the Coternimate with Increment section.</p> <p>Based on the selected purchase identification criteria, the total quantity of an asset spans multiple streams during the increment scenarios, on the Installed Products page (of a renewal quote).</p>
Relate Action Criteria Fields	<p>Enter comma separated asset line item fields to enable relate asset action.</p>
Renewal Business Object Type	<p>Enter the Business object for which this renewal is taking place.</p> <p>Valid values are: <i>Proposal</i> and <i>Agreement</i></p>
Renewal Default Price Book	<p>Enter a Renewal Price Book name which you want to associate with renewals.</p>

Setting	Description
Renewal Execution Mode	<p>This setting indicates if the Renewal of Asset Line Items must happen automatically or based on your specified conditions.</p> <ul style="list-style-type: none"> • Enter Auto to automatically create the Renewal Opportunity on Order activation. Make sure you check Auto Renew on the product PLI, from the Default tab. • Enter OnDemand to create the renewal Opportunity before a certain lead time. You must enter a Renewal Lead Time for this mode to work successfully. To create a renewal Opportunity 90 days before the Asset Expiry, set the Execution Mode to <i>OnDemand</i> and Renewal Lead Time to <i>90</i>.
Renewal Group Fields	<p>Enter the API names of the fields you want to use for grouping. This setting indicates how to group the Asset Line Items when a Renewal Opportunity is created.</p> <p>For Execution mode set to Auto, the system will group the renewal Opportunity by default by the Auto Renew flag - One for the Asset Lines with Auto Renew as <i>True</i> and the other for Asset Lines with Auto Renew as <i>False</i>.</p> <p>For Execution mode set to OnDemand, the system can group the renewal Opportunity by Account and the Price List. However, if the implementation teams want to group the renewal opportunities by other parameters on the Asset Line Item, they can do so by specifying a comma-separated list of API names of the fields in this section. It is recommended to limit the grouping to a maximum of 4 fields.</p>
Renewal Lead Time	<p>Enter a value when the Renewal Opportunity must be created after an order is activated.</p> <p>By default, the value is 0, which indicates that the Renewal Opportunity is created immediately after the order is activated, with the same number of Line Items in the order. If you specify 30, the Renewal Opportunity is created 30 days before the Asset End Date.</p>

Setting	Description
Renew One Ramp	<p>Select this setting to renew only one ramp line item based on the new term in order of renewal term in the asset line item, default renewal term specified in the Installed Product Setting and Selling Term defined in the asset line item.</p> <p>Consider a scenario where multiple ramped assets exist for a quote. In the previous releases, renewing any one of the ramped assets results in the creation of a renewal cart with the same number of ramps as the original proposal. Each ramp line is created from the original deal which implies that the uplift has to be defined from Ramp 1 for accurate prices in the subsequent ramps. Redefining and specifying details for each ramp can be cumbersome and as a user, you would expect that for a three-year ramped deal, the uplift specified on year 3 is applied on renewal to year 4.</p>
Show Accounts Filter	Select this setting to display accounts filter in the Installed Products page. This is currently not supported.
Show Assets	<p>This setting determines whether current, parent, or child assets of the current asset's account are displayed.</p> <p>Enter comma separated values of Parents and/or Children. If empty, only context account assets are shown. Examples:</p> <ul style="list-style-type: none"> • parents • parents,children
Show Service Coverage	Select this setting to display service coverage for a primary service.
Split Asset Actions	<p>Enter the actions that can be performed on a split asset. This setting enables the user to perform split asset actions on the Define Split <asset name> page. Valid values are:</p> <ul style="list-style-type: none"> • Renew: Enables users to perform the Split and Renew asset action. • Swap: Enables users to perform the Split and Swap asset action.

Setting	Description
Submenu Actions	<p>Enter comma-separated submenu actions that you want to display when the user clicks an action button on the Installed Products page. You can configure submenu actions only on the Change and Relate actions. The supported values are:</p> <ul style="list-style-type: none"> • Change:Configuration displays the Configuration submenu under the Change action. This submenu enables users to configure an asset line item. • Change:Quantity displays the Quantity submenu under the Change action. This submenu enables users to initiate an action to add more licenses for an existing asset stream. • Change:Split displays the Split submenu under the Change action. This submenu enables users to split an asset into multiple split lines. • Change:Merge displays the Merge submenu under the Change action. This submenu enables users to merge multiple asset lines into a single asset. • Relate:Component displays the Component submenu as a drop-down under the Relate action. This submenu enables users to relate an asset component with a service.

Lookup Field Settings

Controls lookup field behavior in Apttus CPQ. Lookup field settings provide an ability to filter look up records through filter criteria based on immediate parent on which the lookup field is defined.

Setting	Description
Filter Criteria	<p>Enter a formula to filter lookup values. The formula must be a valid expression to further filter down the search results for a lookup. The field size is 256 characters.</p> <p>Formulas are built with left as a lookup or junction and right as the object.</p> <p>Example: <code>Product__c=Apttus_Config2__ProductAttributeValue__c.Product_Id__c</code></p> <p>This formula fetches only such attributes whose IDs match with the selected products. Here, the ProductId is a custom formula field which fetches the Product Id of the Line Item object.</p>

Setting	Description
Filter Criteria 2	<p>Enter a formula to be used as an extension to Filter Criteria. Contents of this field are concatenated to the content of Filter Criteria without any validation while evaluating.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> There is no space between the expressions when they are concatenated because the leading and the trailing spaces are trimmed. Avoid splitting the expression where space is required. Split the expression mid-way between a word to avoid trimming the space at the beginning or end of a word.</p> <p>For example, Filter Criteria = <i>AccountId_c = '00137000002ttoF' AN</i> Filter Criteria 2 = <i>D TaxExempt_c = 'Yes'</i>. After the fields are concatenated the expression becomes "<i>AccountId_c = '00137000002ttoF' AND TaxExempt_c = 'Yes'</i>". <i>Otherwise, when Filter Criteria = AccountId_c = '00137000002ttoF' AND</i> Filter Criteria 2 = <i>TaxExempt_c = 'Yes'</i>. After the fields are concatenated the expression becomes "<i>AccountId_c = '00137000002ttoF' ANDTaxExempt_c = 'Yes'</i>" and results in a syntax error.</p> <p>Note that there is no space between 'AND' and 'TaxExempt_c'</p> </div>
Junction Default Flag	Enter the name of a field API from the Junction object to determine the default value of a lookup field. This field must be a checkbox.
Junction Field Name	Enter the name of a field on the junction object which you would like to filter the lookup field by.
Junction Object Name	Enter the name of the junction object which you would like to filter the lookup values. This is a custom object that you can define to filter the values which do not exist on the Lookup Object itself.

Setting	Description
Lookup Display Columns	Enter the names of fields to be displayed on the lookup dialog box. Field names must be separated by comma without spaces. The columns of the Lookup popup fields from the Lookup Object will be displayed by populating with the fields APIs from the Lookup Object such as Name__c.
Lookup Field Name	Enter the name for the lookup field. This is the API name of the Lookup field on the Line Item or Product Attribute Value Object defined under the Object Name.
Lookup Record Limit	Enter the maximum number of records to query for the lookup field drop-down. Default value is 200 to a maximum of 1000.
Object Name	Enter the API name of the object where the lookup field exists. Valid values are: <ul style="list-style-type: none"> • <i>Apttus_Config2__LineItem__c</i> • <i>Apttus_Config2__ProductAttributeValue__c</i> • <i>Apttus_Config2__ProductConfiguration__c</i>. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> You can define lookup fields with filter criteria from Product Configuration object in Lookup Fields Settings. This allows you to use lookup fields with filter criteria in features like Mass Update</p> </div>

Following are the scenarios where lookup field settings are required:

Make your product attribute as hidden

While configuring a product, along with its attributes, the product attribute lookup will now display only relevant attributes for the products which you have just selected on the catalog page.

Perform the following steps to hide the Product ID attribute.

Prerequisite: You must create a custom formula field, named *Product Id* to fetch the Product Id of the Line Item object.

1. Navigate to **Product Attribute Groups** by clicking **All Tabs**.
2. Select the appropriate Product Attribute Groups and click **Edit**.
3. Select the **Is Hidden** checkbox for Product Id and click **Save**.

To customize the lookup fields, create a new record under **Custom Settings > Lookup Field Settings > Manage** and fill in the requisite details.

Field	Description
Name	Specify the name for the custom setting.
Display Columns	Specify the API names of fields to be displayed on the lookup dialog box, separated by a comma.
Filter Criteria	<p>Enter a valid expression to further filter down the search results for a lookup. The field size is 256 characters. When the expression exceeds the size, use Filter Criteria 2.</p> <p>Example: <code>Product__c=Apttus_Config2__ProductAttributeValue__c.Product_Id__c</code></p> <p>This will fetch only such attributes whose IDs match with the selected products. Here, the ProductId is a custom formula field which fetches the Product Id of the Line Item object.</p>

Field	Description
Filter Criteria 2	<p>This field is used as an extension to Filter Criteria. Contents of this field are concatenated to the content of "Filter Criteria" without any validation while evaluating.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> There is no space between the expressions when they are concatenated because the leading and the trailing spaces are trimmed. Avoid splitting the expression where space is required. Split the expression mid-way between a word to avoid trimming the space at the beginning or end of a word.</p> <p>For example, Filter Criteria = <code>AccountId_c = '00137000002ttoF'</code> AND Filter Criteria 2 = <code>D TaxExempt_c = 'Yes'</code>. After the fields are concatenated the expression becomes <code>"AccountId_c = '00137000002ttoF' AND TaxExempt_c = 'Yes'"</code>.</p> <p>Otherwise, when Filter Criteria = <code>AccountId_c = '00137000002ttoF'</code> AND Filter Criteria 2 = <code>TaxExempt_c = 'Yes'</code>. After the fields are concatenated the expression becomes <code>"AccountId_c = '00137000002ttoF' ANDTaxExempt_c = 'Yes'"</code> and results in a syntax error.</p> <p>Note that there is no space between <code>'AND'</code> and <code>'TaxExempt_c'</code></p> </div>
Lookup Field Name	<p>Specify the API name for the lookup field.</p> <p>Example: <code>Product_Edition__c</code></p> <p>This is the lookup field containing values such as <i>Enterprise</i>, <i>Standard</i>, and <i>Premium</i>.</p>
Object Name	<p>Specify the object name from which the lookup relationship is created.</p> <p>Example: <code>Apttus_Config2__ProductAttributeValue__c</code></p>

Configuring Users and Queues for Quote Collaboration

You need to configure lookup fields for users and queues so that Quote Collaboration pop up shows the relevant users and queues while assigning the collaboration request.

For configuring User, ensure that you set up the lookup field (under **Custom Settings > Lookup Field Settings > Manage**) with the following values:

Field	Description
Name	CollaborationRequest__c.User.OwnerId
Display Columns	Name
Filter Criteria	UserType = 'Standard' AND IsActive = true
Lookup Field Name	OwnerId.User
Object Name	Apttus_Config2__CollaborationRequest__c

For configuring Queue, ensure that you set up the lookup field with the following values:

Field	Description
Name	CollaborationRequest__c.Group.OwnerId
Display Columns	Name
Filter Criteria	Type = 'Queue'
Lookup Field Name	OwnerId.Group
Object Name	Apttus_Config2__CollaborationRequest__c

Proposal System Properties

Quote/Proposal System properties.

Setting	Description
Admin User	The admin user is the default owner of activities created by a user who is not allowed to be the owner (for example, customer portal user). Enter the admin user name in the following format: Format = first name, last name

Setting	Description
Auto Create Cart Version After Finalize	Select this setting to enable CPQ to create a new version of the cart automatically after it is finalized.
Auto Create Order	Select this setting to enable CPQ to create an order and assets automatically when the proposal is accepted.
Auto Select Attachment?	Select this setting to enable CPQ to select the most recent attachment automatically.
Auto-Select multiple recipients?	Select this setting to enable projects to specify a list of recipients that will be defaulted for eSignature. To use this option, projects will add the DocuSign Default Recipients related list on proposals and user will select the list for each proposal.
Auto Select Recipient Field Name	Enter the API name of the field which holds the value for the recipient to select automatically.
Auto Sync With Opportunity	Select this setting to enable CPQ to synchronize the proposal automatically with the opportunity when the proposal is accepted. This setting automatically synchronizes the quote line items with the opportunity when the proposal is finalized. This setting appears only if you have Apttus Quote/Proposal-Configuration Integration package installed.
Bypass Sharing	Select this setting to enable apex code to bypass record sharing.
Clone With Approval Status	Select this setting to enable CPQ to retain approval status on the cart and line items associated with the cloned quote/proposal.
Create Agreement With Approval Status	Select this setting to enable CPQ to retain the approval status on the quote. When an agreement is created from the quote, the approval status on the quote is transferred to agreement line items associated with the quote.
CSS Override	Enter the name of the static resource to override CSS on the Proposal document generation page.
Custom Doc Gen URL	Enter the custom URL that is accessed when using the custom button on the DocGen page.

Setting	Description
Default Opportunity Quote Owner	<p>Enter the owner name to set the default owner for the quote/proposal created from an opportunity. Valid values are:</p> <ul style="list-style-type: none"> Opportunity Owner Current User <p>If not set, <i>Opportunity Owner</i> becomes the owner of the new quote/proposal.</p>
Default Quote Agreement Owner	<p>Enter the owner name to set the default owner for the agreement created from a quote/proposal. Valid values are</p> <ul style="list-style-type: none"> Quote Owner Current User <p>If not set, <i>Quote Owner</i> becomes the owner of the new agreement.</p>
Default Template Name	<p>Enter the name of the default email template that must be used when sending emails.</p>
Disable Opportunity Products Copy	<p>Select this setting to disable copying of opportunity products to the quote/proposal.</p>

Setting	Description
Document Naming Convention	<p>Enter a value to apply a custom naming convention for all proposal documents at generation.</p> <p>The following attributes are permitted when formulating a document naming convention:</p> <ul style="list-style-type: none"> • %action% • %templatename% • %user% • %timestamp% • %version% • Proposal attributes such as %:Name%. <div style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p> Any variable prefixed by ':' represents a field on the Proposal object.</p> </div> <p>If the property contains a null value (i.e., if left blank), the current default naming convention will be used:</p> <p>"%:Proposal_Name_c%_%templatename%_%timestamp%".</p> <p>Example of a proposal document name using the default naming convention: SOW_Regenerated_SOW ABC_2019-08-07</p>
Email Template For Presenting Proposals	Enter the name of the email template that must be used for presenting proposals.
Enable Document Preview in DocuSign App	Select this checkbox to enable document preview in DocuSign application.
Enable Fast Doc Gen	Select this setting to enable the fast document generation feature.
Enable File	<p>Select this setting to enable the use of files.</p> <div style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p> After you select this setting, it is mandatory to execute the Migration.</p> </div>

Setting	Description
Enable PDF Security	Select this setting to enable users to apply security settings to PDF documents and protect them with a password.
Enable Proposal Email Editing	Select this setting to enable editing of the Proposal email template.
Enable Proposal Summary	Select this setting to enable the proposal summary object.
Enable Submit Merge Call	Select this setting to submit merge calls for processing. If this setting is enabled, the Submit button is displayed during document generation.
ESignatureStrictMode	RESERVED Select this setting to disable buttons for Select Attachments / Recipients.
Instance Url	Enter the Salesforce instance URL.
Large Doc Process Batch Size	Indicates the number of repeating child items to process in a single batch transaction.
Large Doc Threshold	Enter a number of the line items in the proposal when exceeded indicates that the proposal is a large document. Enter -1 to deactivate the threshold.
Max Child Level	Enter the maximum level to generate the merge data for the proposal.
Merge Call Timeout Millis	Enter the timeout in milliseconds for the merge request. For example: 60,000
Merge Webservice Endpoint	Enter the Apttus merge webservice endpoint.
PDF Owner Password	Enter the password required to change permissions of the PDF document like printing or editing.

Setting	Description
Sync Bundle Using Line Items	Select this setting to use proposal line items to synchronize bundle products. By default, CPQ uses proposal summary objects. This setting appears only if you have Apttus Quote/Proposal-Configuration Integration package installed.
Sync Option Products	Select this setting to enable CPQ to synchronize the option products with the bundle. This setting synchronizes options with bundles when you click Sync with Opportunity for your proposal. This setting appears only if you have Apttus Quote/Proposal-Configuration Integration package installed.

Configuring Field Set Settings

The Field Set settings page allows the System Administrator to configure the field sets.

You can enter details in one or more of the following sections, based on your business requirement.

Setting	Description
Name	<p>Select a Field Set from the drop-down list.</p> <p>The available Field Sets are as follows:</p> <ul style="list-style-type: none"> • Collab Create Fields • Collab Merge Fields • Line Item Fields to Revalidate Invalid Price List Items • Line Item Fields to Revalidate Product Structures • Related Line Item Fields • Asset Line Fields For Selected Assets

Setting	Description
FieldName	<p>Select a field that you want to add to a Field Set. For example, you may want to add Record ID, Created Date to the Collab Create Fields.</p> <p>These fields are populated in the drop-down lists from the corresponding objects. For example, Asset Line Item object for the asset field set.</p> <p>Click + symbol to add a field and - symbol to remove a field from the field set.</p> <p>Click Up and Down arrows in front of each field to set a sequence in which fields to be displayed in the field set list.</p> <p>Click Save to set your configuration.</p>

Each field set is meant for a specific business scenario.

Field Set	Scenario
Collab Create Fields	<p>In a multi-tier collaboration scenario, specify the additional fields whose value you want to copy over from parent line item to child line item when creating a collaboration request.</p> <p>For more information, see Quote Lifecycle Collaboration in the user guide.</p>
Collab Merge Fields	<p>In a multi-tier collaboration scenario, specify the additional fields whose value you want to copy over from child line item to parent line item when merging a collaboration request.</p> <p>For more information, see Quote Lifecycle Collaboration in the user guide.</p>
Line Item Fields to Revalidate Invalid Price List Items	<p>When you select the Price List Item field for the Line Item Fields to Revalidate Product Structures set, then you can have a validation based on the price list item.</p> <p>For more information, see Re-validating the Product Configuration in the user guide.</p>

Field Set	Scenario
Line Item Fields to Revalidate Product Structures	<p>When you select the Price List Item field for the Line Item Fields to Revalidate Product Structures set, then you can have a validation based on the price list item.</p> <p>For more information, see Re-validating the Product Configuration in the user guide.</p>
Related Line Item Fields	<p>When you select the Weightage Type field for the Related Line Item Fields set, then you can define the percentage and the amount values for the Related Asset Line Items on the cart.</p> <p>The Related Asset Line Items are associated with a Service Product.</p> <p>For more information on the Service CPQ, refer to "Managing Services" in <i>CPQ on Salesforce User Guide</i>.</p>
Asset Line Fields For Selected Assets	<p>When you select Location field for the Asset Line Fields for Selected Assets set, then you can view the location at which the product was sold to the customer.</p> <p>For more information on the Service CPQ, refer to "Managing Services" in <i>CPQ on Salesforce User Guide</i>.</p>

Smart Search Setup

You can use the Smart Search feature to search for products in large and complex product catalogs, with multiple levels of categories and stricter rules. The smart search typeahead mechanism and faceted search helps narrow the search results and still honor product visibility and availability rules.

You must setup remote site before you configure settings for Smart Search.

Setting up Remote Site Settings

Navigate to **Setup > Administration Setup > Security Controls > Remote Site Settings** and click **New Remote Site** to create the following records:

Record number	Remote Site Name	Remote Site URL
1	SmartSearch	<p>https://<SMART_SEARCH_URL></p> <p>Smart Search URL can be any of the following:</p> <ul style="list-style-type: none"> • AZURE PREVIEW: smartsearch-pre-appgw.apttuscloud.io (Nov 2016 SP1 GA - Version 9.1168 and above versions) <p>For any fresh package installation, Azure URL defaults.</p>
2	SFDC	<ul style="list-style-type: none"> • For production environment, enter https://login.salesforce.com • For sandbox environment, enter https://test.salesforce.com
3	OauthToken	<ul style="list-style-type: none"> • For production environment, enter https://login.salesforce.com/services/oauth2/token • For sandbox environment, enter https://test.salesforce.com/services/oauth2/token

Creating a Certificate

Navigate to **Setup > Administration Setup > Security Controls > Certificate and Key Management** and click **Create Self-Signed Certificate** to create a new certificate with the following details:

1. Enter *JWT* as the label for the certificate. The Unique Name defaults to *JWT*.
2. Select the **Exportable Private Key** checkbox.
3. Choose Key Size as *2048*.
4. Select the **Active** checkbox.
5. Click **Save**.

Once you have created a certificate, go to your certificate record and click **Download Certificate** to store the certificate on your local system. You will need the certificate while creating a connected app.

Creating a Connected App

1. Navigate to **Setup > App Setup > Create > Apps**.
2. Scroll down and search for **Connected Apps** related list. Click **New** to create a new app.

3. Enter the basic information, **Connected App Name** and **API Name** as *ApttusSmartSearch*.
4. In the API (Enable OAuth Settings) section, select **Enable OAuth Settings** checkbox.
5. In the Callback URL, enter `https://<login OR test>.salesforce.com/services/authcallback/<org-id>/ApttusSmartSearch`
In *<login OR test>* enter login or test depending on your environment. In *<org-id>*, enter your org ID.
6. Select the **Use digital signatures** check box. Choose the file from generated certificate.
7. For **Selected OAuth Scopes**, select the following:
 - Access and manage your data (api)
 - Access and manage your Chatter data (chatter_api)
 - Perform requests on your behalf at any time (refresh_token, offline_access)
8. Click **Save**.

Approving your Connected App

Before approving your connected app, you must decide which OAuth policy you would like to have. This policy decides which permitted users can work on Smart Search's admin page. Admin approved users are pre-authorized. You can also authorize other users and for such users, the steps mentioned in Approving your Connected App procedure are mandatory.

Step 1: Managing Profiles for Connected App

1. Navigate to **Setup > Administration setup > Manage Apps > Connected Apps**.

2. Next to the ApttusSmartSearch connected app record, click **Edit**.
3. Under the OAuth Policies section, in Permitted Users drop-down list, choose *Admin Approved Users are Preauthorized* and click **Save**.
4. Scroll down and search for Profiles section. Click **Manage Profiles** and select the profiles that you want to give access to the Smart Search App.

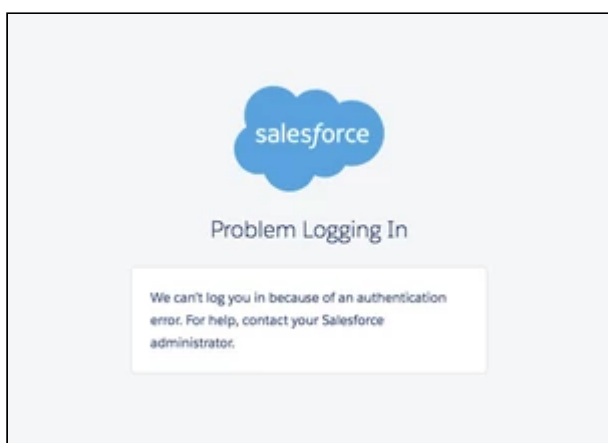

5. Click **Save**.

Step 2: Approving your Connected App

1. Navigate to **Setup > App Setup > Create > Apps**.
2. Scroll down and search for **Connected Apps** related list.
Click your *ApttusSmartSearch* record and save the values of the Consumer Key, Consumer Secret, and Callback URL fields in a text file. You will need these keys to set up the last step for smart search.
3. Go to your browser URL, paste the following URL and click **Enter**:
`https://<login OR test>.salesforce.com/services/oauth2/authorize?response_type=code&client_id=<consumer-key>&redirect_uri=<callback-url>`

Use the correct domain for **<login or test>**, enter your consumer key and callback URL which you have fetched in the above step in **<consumer-key>** and **<callback-url>**. Note that **<callback-url>** needs to be encoded.

4. Click **Allow** to give permission to your connected app.
5. You will see the following page, which is the expected behavior of the app. You can now close the browser tab.

Smart Search Settings

You must follow the steps below to configure Smart Search.

 Please contact Apttus Product Support team to enable the Smart Search capability for your org.

- [Prerequisite](#)
- [Smart Search Config Settings](#)
- [Setup Apttus Intelligent Cloud Search Connection Settings](#)
- [Add and Review Product Field Weightage](#)
- [Push Data into Search Engine](#)
- [Refresh Data in Search Engine](#)
- [Remove Data in Search Engine](#)
- [Review Sync Status](#)
- [Switch to Azure Smart Search](#)

Prerequisite

Setup the remote site for Smart Search. Refer to [Smart Search Setup](#).

Smart Search Config Settings

Go to **Config Settings > Smart Search Settings**. This page lists all the smart search specific settings that you need to set up.

Setup Apttus Intelligent Cloud Search Connection Settings

Please contact Apttus Product Support/PS/CSM team to obtain the URL and API User Key.

Setting	Description
Enhanced Search URL	Specify the URL end point for enhanced product search. With Enhanced Search URL populated with the correct URL, the system synchronizes all the changes at every hour and displays the results in the Review Sync Status section. If you do not specify the Enhanced Search URL , the system neither performs the sync nor updates the information in the Review Sync Status section.

Setting	Description
Api User Key	Specify the API key that consists of the client ID and is used for smart search related activities. This key is required before Search Activation/Deactivation and resync. An error is displayed if you activate, deactivate or resync without the API User Key.

Add and Review Product Field Weightage

The weightage allocation enables the Smart Search to control the ranking of the search results based on customer needs. The total for the weightage is 100% and this can be split into any number of Product Fields that participate in the search criteria. For example, 70% weightage to product name and 30% weightage to product code means that if for a search text there is a match with a product name as well as a product code, the product name match will be ranked higher in the result. This capability allows the customers to fine tune the search results and also include custom fields that may be included in the search criteria.

To define the criteria, the admin is required to define the map as follows. The map of fields and corresponding weightage can be different for each flow.

1. Select the desired flow using **Flow** drop down.
2. Select the desired field using **Field Name** drop down. Select the desired weightage in percentage using **Weightage** drop down.
3. Click **Add Row**, if you need to add an additional field. You can add product fields such as Product Name, Description, Product Code, and more. Ensure that total weightage sum of all the fields equals to 100%.

The system supports fields of type text, picklist, rich text, and number. It can also be a mix of all these types of fields. You can add a maximum of 6 fields.

4. Click **Save**.

Push Data into Search Engine

This is a one-time Activation step. This enables the system to set up new indexes and push the product data that runs the catalog and search.

Click **Search Activation**.

Refresh Data in Search Engine

This step is required to be executed any time there is change to the base line setup or “search meta-data”. This includes:

- New fields are added to the weightage criteria.
- New fields are added to the Refine Search filter.
- New fields are added to the product catalog listings.

Click **Search Metadata Refresh**. You need to refresh the metadata only when you have made changes to the product schema or data.

Remove Data in Search Engine

This step is required when you want to deactivate the Smart Search functionality in your org and purge data from our servers.

Click **Deactivate Search**.

Review Sync Status

This section displays the details about the last Sync job performed for Smart Search Settings. The fields such as **Sync Message**, **Last Attempted Sync**, **Last Successful Sync** and **Current Sync Status** depict the necessary information about the Sync job. The Review Sync Status is changed when you activate Smart Search (by clicking **Search Activation**), run the batch job and deactivate the Smart Search (by clicking **Deactivate Search**).

Switch to Azure Smart Search

You can now switch the search engine from *Solr* to *Azure* for faster search results. Create a new record under **App Setup > Develop > Custom Settings > Config Smart Search Settings > Manage** with name *SmartSearchSync*. Inside this record, specify the **Search Environment** as *Azure*.

Note

By default, the value in **Search Environment** is set to *Azure* for new package installation. For upgrade (if you are already using Smart Search), you must deactivate the smart search, change the search environment and then activate the smart search.

Upgrading Apttus CPQ

This section provides information on upgrading Apttus CPQ to the latest version from the previous two releases.

 If you have not installed Apttus CPQ, you can contact Apttus Support to request for an installation link, then perform the standard installation as described in [Installing Apttus CPQ](#).

Preparing for Upgrade

Before you upgrade to CPQ on Salesforce Summer 2020, you must ensure the following:

- You go through [CPQ on Salesforce Feature by Release](#) to know about the new features, enhancements, and deprecated features in CPQ since your existing release. After you upgrade CPQ to Summer 2020, you cannot roll back to any previous release.
- You have the [supported platforms and system requirements](#).
- You have access to the **Install Center** on the [Apttus Community Portal](#).
- You have administrator privileges to your Salesforce org.
- You need not back up your configurations. All configurations you performed since you installed your existing release will remain intact after the upgrade.

Upgrading to CPQ on Salesforce Summer 2020

This section describes step-by-step instructions to upgrade from Spring 2020 and Winter 2019 to Summer 2020.

 You must install the Apttus Base Library package first when you upgrade CPQ to Summer 2020.

Upgrading CPQ from Spring 2020 to Summer 2020

1. Go to **Setup** > **Installed Packages** and ensure that your current Salesforce org has the following Spring 2020 packages installed.

Product	Latest Certified Version <i>(Version Name Version Number)</i>
Apttus Approvals Management (Required if you are using Approvals)	11.0.0114 11.114
Apttus Base Library (Required if you are using Apttus Configuration & Pricing)	1.0.40 1.40 <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> Mandatory package to be installed in the Spring 2020 release.</div>
Apttus Configuration & Pricing	12.0.1719 12.1719 Spring 2020
Apttus Contract Management	11.0.0518 11.518
Apttus Contract-Configuration Integration (Required if you are using CLM)	12.0.0130 12.130
Apttus CPQ API	12.0.0100 12.100
Apttus CPQ Admin (Required if you are using CPQ Admin Console)	12.0.54 12.54
Apttus CPQ Approvals Management (Required if you are using Approvals on CPQ objects)	11.0.0016 11.16
Apttus Deal Maximizer Setup (Required if you are using Deal Maximizer)	7.5.0046 7.46
Apttus Order Management	1.0.0000 1.0
Apttus Promotion Management (Required if you are using Promotions)	1.0.0000 1.0
Apttus Proposal Management (Required if you are using Proposal Management)	10.0.0210 10.210

Product	Latest Certified Version <i>(Version Name Version Number)</i>
Apttus Quote/Proposal Approvals Management	6.5.0004 6.4
Apttus Quote/Proposal-Asset Integration	6.5.0014 6.14
Apttus Quote/Proposal-Contract Integration	9.0.0055 9.55
Apttus Quote/Proposal-Configuration Integration (Required if you are using CPQ and Proposal Management)	12.0.0324 12.324

2. Ensure that you have the following packages and dependent packages to upgrade to Summer 2020. These packages are required to utilize the new features and enhancements of Summer 2020. These are the *minimum* required versions; later versions are also supported.

Product	Latest Certified Version <i>(Version Name Version Number)</i>
Apttus Approvals Management (New) (Required if you are using Approvals)	11.1.0161 11.161
Apttus Base Library (New) (Required if you are using Apttus Configuration & Pricing)	1.1.93 1.93
Apttus Configuration & Pricing (New)	12.1.1787 12.1787 Summer 2020
Apttus Contract Management (New)	11.1.0547 11.547

Product	Latest Certified Version <i>(Version Name Version Number)</i>
Apttus Contract-Configuration Integration (New) (Required if you are using CLM)	12.1.0136 12.136
Apttus CPQ API (New)	12.1.0104 12.104
Apttus CPQ Admin (New) (Required if you are using CPQ Admin Console)	12.1.61 12.61
Apttus CPQ Approvals Management (New) (Required if you are using Approvals on CPQ objects)	11.1.0018 11.18
Apttus Deal Maximizer Setup (New) (Required if you are using Deal Maximizer)	7.5.0050 7.50
Apttus Order Management	1.0.0000 1.0
Apttus Promotion Management (Required if you are using Promotions)	1.0.0000 1.0
Apttus Proposal Management (New) (Required if you are using Proposal Management)	10.1.0221 10.221
Apttus Quote/Proposal Approvals Management	6.5.0004 6.4
Apttus Quote/Proposal-Asset Integration	6.5.0014 6.14
Apttus Quote/Proposal-Contract Integration (New)	9.1.0063 9.63
Apttus Quote/Proposal-Configuration Integration (New) (Required if you are using CPQ and Proposal Management)	12.1.0332 12.332

3. Perform the upgrade. The upgrade procedure is the same as the installation procedure. For detailed information on installing CPQ managed packages, see [Installing the Apttus CPQ Packages](#).
4. After the upgrade is complete, perform the [post-upgrade](#) tasks.

Upgrading CPQ from Winter 2019 to Summer 2020

1. Go to **Setup > Installed Packages** and ensure that your current Salesforce org has the following Winter 2019 packages installed.

Product	Version Name Version Number
Apttus Approvals Management (Required if you are using Approvals)	10.2.0077 10.77
Apttus Configuration & Pricing	11.2.1675 11.1675 Winter 2019
Apttus Contract Management	10.2.0491 10.491
Apttus Contract-Configuration Integration (Required if you are using CLM)	11.2.0123 11.123
Apttus CPQ API	11.2.0096 11.96
Apttus CPQ Admin (Required if you are using CPQ Admin Console)	11.2.45 11.45
Apttus CPQ Approvals Management (Required if you are using Approvals on CPQ objects)	10.1.0014 10.14
Apttus Order Management	1.0.0000 1.0
Apttus Promotion Management (Required if you are using Promotions)	1.0.0000 1.0
Apttus Proposal Management (Required if you are using Proposal Management)	9.2.0206 9.206
Apttus Quote/Proposal Approvals Management	6.5.0004 6.4

Product	Version Name Version Number
Apttus Quote/Proposal-Asset Integration	6.5.0014 6.14
Apttus Quote/Proposal-Contract Integration	8.2.0053 8.53
Apttus Quote/Proposal-Configuration Integration (Required if you are using CPQ and Proposal Management)	11.2.0312 11.312

2. Ensure that you have the following packages and dependent packages to upgrade to Summer 2020. These packages are required to utilize the new features and enhancements of Summer 2020. These are the *minimum* required versions; later versions are also supported.

Product	Latest Certified Version <i>(Version Name Version Number)</i>
Apttus Approvals Management (New) (Required if you are using Approvals)	11.1.0161 11.161
Apttus Base Library (New) (Required if you are using Apttus Configuration & Pricing)	1.1.93 1.93
Apttus Configuration & Pricing (New)	12.1.1787 12.1787 Summer 2020
Apttus Contract Management (New)	11.1.0547 11.547
Apttus Contract-Configuration Integration (New) (Required if you are using CLM)	12.1.0136 12.136
Apttus CPQ API (New)	12.1.0104 12.104
Apttus CPQ Admin (New) (Required if you are using CPQ Admin Console)	12.1.61 12.61

Product	Latest Certified Version <i>(Version Name Version Number)</i>
Apttus CPQ Approvals Management (New) (Required if you are using Approvals on CPQ objects)	11.1.0018 11.18
Apttus Deal Maximizer Setup (New) (Required if you are using Deal Maximizer)	7.5.0050 7.50
Apttus Order Management	1.0.0000 1.0
Apttus Promotion Management (Required if you are using Promotions)	1.0.0000 1.0
Apttus Proposal Management (New) (Required if you are using Proposal Management)	10.1.0221 10.221
Apttus Quote/Proposal Approvals Management	6.5.0004 6.4
Apttus Quote/Proposal-Asset Integration	6.5.0014 6.14
Apttus Quote/Proposal-Contract Integration (New)	9.1.0063 9.63
Apttus Quote/Proposal-Configuration Integration (New) (Required if you are using CPQ and Proposal Management)	12.1.0332 12.332

3. Perform the upgrade. The upgrade procedure is the same as the installation procedure. For detailed information on installing CPQ managed packages, see [Installing the Apttus CPQ Packages](#).
4. After the upgrade is complete, perform the [post-upgrade](#) tasks.

Performing the Post-Upgrade Tasks

After you upgrade to this CPQ release, consider the following options and requirements:

- [Object Maintenance](#)
- [Adding Custom Fields to Config Lineltem Custom Fields](#)
- [Custom Labels for Custom Actions](#)

Object Maintenance

After upgrading your packages, you must run the object maintenance tasks to synchronize all your previous configurations.

To access the maintenance pages, click the **All Tabs** icon (+) to display all tabs and click the link for each required maintenance. When you run maintenance jobs after an upgrade, you must run them in the order below, in the instances described for each:

- **Product Filter Maintenance** - After every upgrade, you must run this task, which collects all product filter field values related to a category. The maintenance job updates the required records for all the categories every time you run it. You must also run the maintenance task every time there is a change in products or a change in the filter field values.
- **Category Maintenance** - After any product association, removal or hierarchy change, you must run a Category Maintenance job. This de-normalizes the hierarchy into a custom object for reporting and totaling purposes. If category maintenance is not run, the end-user may see incorrect totals on the shopping cart page.
- **Constraint Rule Maintenance** - This should be run after any changes are made to Constraint Rule conditions. If it isn't run, products may not be included or excluded as expected.
- **Bundle Maintenance** - When options are added or removed from a bundle, you must use the Update Bundle Components page to run a bundle maintenance job that synchronizes all the bundles and options.
- When you run bundle maintenance for all bundles, be sure to only click the button once to avoid scheduling multiple unnecessary bundle maintenance jobs. To track the progress of the job, you should go to **Setup > Administration Setup > Monitoring > Apex Jobs**. You see the bundle jobs and whether they have been completed.
- **Attribute Maintenance** - After an attribute group is associated with a category, run this job to associate the attribute with the products that belong to the category.

- **Criteria Maintenance** - After any pricing change (rules, dimensions or any criteria change), you must run a Criteria Maintenance job.

i Ensure that you run the Criteria Maintenance job only if you have active rulesets or have made any updates to the active rulesets.

Adding Custom Fields to Config Lineltem Custom Fields

If your implementation uses the custom callback class related to Pricing, Related Pricing, Asset Line Item, and Validation, then the API names of the custom fields referred in the custom callback class must be defined in the following custom setting:

Config Lineltem Custom Fields

If the length of the text field exceeds the first column, use the next text fields for this.

Custom Labels for Custom Actions

After upgrading, it is recommended that you create custom labels for any custom actions. Note that you must do it for each flow or action combination, otherwise none of the buttons are displayed on the cart.

For more information, see [Configuring Display Actions Settings](#).

Creating an Opportunity in Salesforce

Opportunities are the qualified contacts or accounts that you have already talked to and have entered into your sales cycle. Adding opportunities to Salesforce builds your pipeline and increases your sales forecast. You will use the Salesforce Opportunities tab to create and find your opportunities.

The CPQ process begins as soon as you create an opportunity.

i Opportunities are standard Salesforce objects, not Apttus custom objects. For more information on opportunities, see Salesforce documentation.

To create an opportunity

1. Log in to [Salesforce.com](https://www.salesforce.com).
2. Navigate to the **Opportunities** tab, and click **New**.

3. Enter the **Opportunity Name**, **Account Name**, **Close Date**, and **Stage**.
4. Enter additional information as required.
5. Click **Save**.

You have created an opportunity. For complete information about creating opportunities in Salesforce, refer to [Create Opportunities](#) and [Opportunity Fields](#) in the Salesforce documentation.

Creating a Shopping Cart Experience

A CPQ administrator configures the Apttus CPQ in order to create a shopping cart experience for the user.

Consider that ABC company sells products related to computers. Products including monitor, keyboard, mouse, Operating System, tools are sold by the ABC company. Each of these products can be sold as a stand-alone product or together as a bundle. For example, all of these products can be integrated as a bundle called computer where each of these products are options. Furthermore, each product has attributes associated with it. Attributes are features for a product. For example, attributes for a laptop are color, RAM, Operating System used and so on. You can configure attributes to derive pricing or enhance search options.

Each of these products has a price associated with it. Pricing can be different for each of these products sold as a stand-alone or when you buy a computer.

A sales representative can simply select a product when it is categorized rather than to search for the product from the huge array of products. A shopping cart experience for a user is enhanced when the user gets to search for his products based on some search criteria. The search criteria can be based on features of a products.

The sales of a product can be improved if user is advised to buy another product when he selects one product. For example, if a user buys a monitor, he will also be interested to buy a keyboard.

Consider that there is a holiday and the ABC company decides to promote a new product. User get discount of x% for all products from October to December.

All of this is configured by using Apttus CPQ.

Perform the following to configure Apttus CPQ:

1. Defining the products and services
2. Configure price for products
3. Configure rules that define pricing discounts and offers
4. Configure rules that guide user to buy products
5. Define search mechanism to search based on attributes
6. Run the maintenance jobs to update all changes made to products, bundle, category, and pricing.

Running Maintenance Jobs

As an administrator, you can run the following maintenance jobs.

Job	Definition
Category Maintenance	This job creates a de-normalized view for the Categories with related products.
Criteria Maintenance <ul style="list-style-type: none"> • Update Pricing Fields • Update Expression Fields • Update Constraint Fields 	These jobs optimize the query time by creating indexes for the fields that are referred to in the criteria or expressions.
Bundle Maintenance	This job synchronizes all the bundles and options.

You must execute an appropriate maintenance job after applying structural changes to the definition of categories, products, or criteria to ensure that the Sales rep does not see stale definition in CPQ application. A stale definition may cause errors in the console or application.

Pre-requisite

- Go to **Setup > Administration Setup > Email Administration > Deliverability**. In the **Access to Send Email** section, ensure that the **Access Level** is set to **All Email**.
- Define **Update View Product Batch Size** and **Update View Category Batch Size** in Config System Properties.

To run a Category Maintenance job

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Category Maintenance**. The Category Maintenance window is displayed.
3. From the **Hierarchy** drop-down, select a particular hierarchy or *All* and click **Update View**. After the maintenance job is 100% complete, the **Status** column under **Batch Jobs** changes to Completed.

4. Close the Category Maintenance window.

This executes an asynchronous batch job that maintains the hierarchy. After you click **Update View**, the administration task is complete and an updated history for all the batch jobs is displayed.

To use Manual Incremental Update for Category Views

After making changes to the existing category definition you can run the Category Maintenance batch job only for changes rather than running for the entire definition. For example, if your category has 10 products and you added 5 more, you can run the Category Maintenance batch job only for the 5 additional products. To execute the Category Maintenance batch job for the changes, you must define an Admin Property that is used by Apttus CPQ to isolate the changes in the category.

Follow the steps below to add an Admin Entry.

1. Click the All tabs icon () and click **Admin**.
2. Click New to create a new Admin entry.
3. In the **Name** field, enter *APTS_UpdateViewProductClasses*. Leave the fields **Value** and **Code** blank.
4. Click **Save**.

Now, if you change the category definition, the **Code** field in the Admin property is populated with the Product Classification records of the newly added products. These records are created after you associate products to the category. When you execute the Category Maintenance batch job, the maintenance batch job is only executed for the changes and not the entire definition. In case, you want to execute a maintenance batch job for the entire definition, clear the **Code** field in the Admin Entry and then execute the Category Maintenance batch Job.

 You must run the Category Maintenance batch job after every CPQ version upgrade.

To run a Criteria Maintenance job

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. Click the more icon () on the top-right corner and select **Criteria Maintenance**. The Criteria Maintenance window is displayed.
3. Click one of the following buttons.

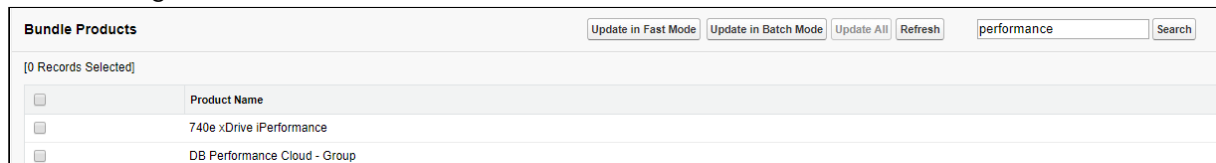

- **Update Pricing Fields:** Use this command to update all Pricing Criteria fields.
- **Update Expression Fields:** Use this command to update all Expression Criteria fields.
- **Update Constraint Fields:** Use this command to update all Constraint Criteria fields.

After the maintenance job is 100% complete, the **Status** column under **Batch Jobs** changes to Completed.

4. Close the Criteria Maintenance window.

To run a Bundle Maintenance Job

1. Click All Tabs icon() and click **Bundle Maintenance**.
2. From **Product Name**, select the name of the parent bundle, whose sub-bundles have been changed.

Bundle Products	
[0 Records Selected]	
<input type="checkbox"/>	Product Name
<input type="checkbox"/>	740e xDrive iPerformance
<input type="checkbox"/>	DB Performance Cloud - Group

3. Do one or more of the following:
 - To update the selected bundle, click **Update In Batch Mode**.
 - To update all the bundles in the list, click **Update All**.
 - To update basic bundles with a limited number of options, click **Update in Fast Mode**.

 Run Bundle Maintenance in Batch Mode instead of Fast Mode if the bundle has a large number of options and sub-bundles. Bundle Maintenance in Fast mode can only be used for a limited number of options and sub-bundles. If that limit is exceeded an error is displayed.

The system displays a confirmation message indicating that the process completed successfully.

The asynchronous task that maintains the product bundle structure is executed.

To run maintenance of view record for individual bundles

1. Navigate to the **CPQ Console** tab and click **Manage Products**.
2. Select an existing bundle to which you want to add or remove a bundle or an option.
3. Click **Product Console**.

4. From the **Catalog** section, click **Manage Bundles/Options**.
5. After making changes to the product association, click **Update View**.

The view record of the selected bundle is updated.

Managing Products

Products are the primary component of your CPQ system. Using CPQ, you can create individual products and product bundles. Once you've created products, you can associate attributes and options to them. Options are the additional accessory products to sell together with a product. Attributes allow you to associate product specifications such as color, size, or model.

You must associate the products with Categories to classify products into logical groups. You can define hierarchies in a category to further divide the products into the smaller groups. On the Catalog page, CPQ displays the categories and hierarchy containing the products you associate with them.

Using feature sets, you can also configure Apttus CPQ to allow your users to compare the features of multiple products. By implementing feature sets, you allow your users to compare products and choose the product that best meets their requirements.

- [About Products](#)
- [Managing Categories and Hierarchies](#)
- [Managing Bundles](#)
- [Managing Product Groups](#)
- [Creating and Maintaining Attributes](#)
- [Configuring Product Visibility](#)
- [Configuring Product Comparison](#)
- [Configuring Numeric Expressions](#)

About Products

Products are standard products or services you sell to your customers and are defined in the standard Salesforce products table. A product is classified as one of the following types: Standalone, Bundle, or Options. This section shows you how to create products and then group the products to make them easier for customers to find.

A standalone product can be sold on its own under the offering category; whereas options can be grouped together as an option group and then associated with a bundle product to be categorized as an offering. You can also associate a bundle with another bundle.

The following sections describe various product operations about creating products.

- [Navigating the Product Page](#)
- [Creating Products](#)
- [Cloning Products](#)

- [Configuring Product Families](#)
- [Configuring Language Support for CPQ](#)

Navigating the Product Page

When you launch the CPQ Admin console, Manage Product page is displayed. All the existing products are listed on this page along with their details. You can configure the columns displayed on the Manage Product Page. There are various functionalities available for you to manage the products.

Product Search

Search for the product to narrow down the product list using the Search Products box. Enter a keyword related to your product details like Product Name, Product Code, Configuration type, description. Search Product box returns all the products that contain that keyword in the product details.

There are two types of search available on the products homepage. Saved Search and Product search query.

 Either of the search filters is applicable at a time.

Saved Search provides you with various options to search, sort, and filter products. You can either define search criteria to search for a range of products or use the product search option. The search query uses options provided in the Field, Operator, and value and displays a search result that matches the criteria. Saved Search functionality lets you save a set of filters you define that narrows down the list of products according to your requirement.

Perform the following steps to view and search configured products in the Saved Search:

1. Click **View All** to view all products that are configured on the Apttus CPQ on the dashboard. If you have queried a filter or a product, then a select **View All** to disable the existing search filter.
2. Click **New Search**. A window that consists of various fields, operators, and values are displayed.
 - a. **Field:** All product Fields are available in the drop-down list such as Text, Checkbox, Date, Date/Time, Number, Percent, Picklist, Multi-Select Picklist, Currency.

- b. **Operator:** Operators that are available for selection helps create the filter expression. Operators are displayed based on the field types. For example, a picklist value will display equal to and not equal operators and a text field will display equal to, not equal to, starts with, contain, does not contain operators. If it is a multi-value picklist, the application displays include and does not include operators.
 - c. **Value:** Enter a value.
 - d. Click one of the following options to execute the search:
 - Click **Save As** to save the search filter and use the filter criteria.
 - Click **Apply** to enable the search filter.
 - Click **Cancel** to cancel the search criteria.
3. To search a product in the Product Search, enter the name of the product that you want to search in the search field. Products that match the search are displayed.
 4. Click field headers in the product's dashboard to sort dashboard based on the field.

You can simply click the saved search record you created and the system filters the search results. You can see the saved searches dropdown list in alphabetical order for better accessibility of your list of saved searches. If you have configured a customized view, click the menu icon () next to the New Search button. The following options are displayed.

- **Edit View:** Displays a new search window.
- **Save View As:** Displays options to Save the edit view.
- **Remove View:** Removes the filter.

You can also narrow down the list using the column search (inline search). Enter a keyword related to the column in space under the column name. Unlike the Search Product field, column search matches the keyword in that particular column. Use the keywords True and False for the checkbox type columns. You can enter keywords in multiple columns at the same time, the result displayed contains the products with details matching to all keywords you entered in different columns.

The screenshot shows the APTTUS interface with a search filter applied. The filter is set to 'Product Name' equal to 'Amazon'. The search results table is as follows:

Product Name	SKU	Status	Family	Must Configure	Version	Product Type	Material	PickList	Test MO Len	Product Hierarchy 1	Product Hierarchy 2	Product Hierarchy 3
ADVANCED BIOLOGICAL MICROSCOPE 1000	44106	✓	Standalone	⊙								
ADVANCED BIOLOGICAL MICROSCOPE 500	44104	✓	Standalone	⊙								
ADVANCED STEREO MICROSCOPE	44202	✓	Standalone	⊙								

Refresh the page to clear all the filters.

Sorting and Adjusting the Columns

You can sort the product by clicking the column names. The products are sorted alphabetically, every time you click the column name the sorting switched between ascending and descending order. You can adjust the column width by dragging the columns. Hover near the column boundaries till two-way arrow appear. Click when the arrow appears and drag left or right to adjust the column width. At the bottom of the page, you can control the number of products to be displayed on each page. You can select the number of products from a pre-defined list. You cannot configure this list. By default, you see 50 records on each page.

Product Details

Product details hold the information about the product. You can view them on the Manage Product page or the product details page. When you click the product name displayed in blue color, the **DETAILS** tab is displayed. All the primary details of the products are displayed on this page. Other tabs on the secondary toolbar hold the additional information like options information, price list associated with the product, rules associated with the products. You can edit the details on this page.

You can use the Mini Display functionality to view the details without leaving the Manage Product page. Click the information in any column other than the product name for the respective product. A panel on the right-hand side displays the details of the product. You cannot edit any details on the mini display. Click the edit icon to go to the **DETAILS** tab, to edit the details.

Creating Products

A Product in Apttus terminology is a product or service that can be set up to be sold on its own as a standalone product or options of other products. Products or services are set up as standalone, bundle, or options of other products. You can associate a product to a category or a price list. If you created an option product, you must first associate it with an option group.

- Standalone - This is an individual product that can be sold on its own.
- Bundle - Any product that has other products (options or bundles) associated with it.
- Options - This is a product that can be sold with a bundle product only through an option group.

To create a product

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**. Click **New Product**. The product details page is displayed. **Details** tab opens by default.
3. Enter the following product information, as required.

Option	Description
Product Name	Enter a name for the product.
Product Code	The Product Code can be an internal code or a product number to identify the product within your organization.
Product Family	Enter a Product Family to categorize the products. If the required Product Family is not displayed in the list, you must add a picklist value in the Product Family field on the Product object. For more information refer to Configuring Product Families .
Uom	Select a unit of measurement.
Product Description	Enter a description of the product. This description is displayed when the user clicks the product name on the catalog page.

Option	Description
Configuration Type	Select one of the following types of product: <ul style="list-style-type: none"> • Standalone • Bundle • Option This field is mandatory.
Must Configure	Indicates that the user has to configure a product to add options or attributes or both. The Configure button is the only option available on the Catalog page. When you select Must Configure, you must also select either Has Options , Has Attributes , or both. Clearing the checkbox allows an end user both the options; either add the product to cart directly or configure the product with attributes or options, or both.
Has Options	Indicates a product as a bundle that has options (bundles/options). You can associated options and option groups to the bundle on the Structure tab. Options and Options groups are not displayed on the Configuration page, is this disabled.
Has Attributes	Indicates that the product has attributes associated to it. During the quote creation process, the end user can enter values for those attributes. Using the product attributes administration tool, you can associate product attributes to products .
Active	Indicates the product is active. The Product is not displayed on the Catalog page if this setting is not selected.
Product Type	Select a type of product. For example, Equipment, Service, and so on.
Has Search Attributes	Indicates that the product has search attributes and is useful for searching related products based on product attribute values.

The fields on the details page are customizable. For more information refer to the [Navigating the CPQ Admin User Interface](#) topic.

4. Click **Save**.

A product is created and saved.

Cloning Products

You can also create new products by cloning existing products. You can clone the product with partial or entire configuration details. This helps you to save time if you want to create a large number of products with a similar configuration.

To clone a Product

Follow the steps below.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. From the menu icon () next to the **New Products** button, click **New from Clone**. A pop-up is displayed.
4. Fill in the required details.

Option	Description
New Product Name	Enter a name for the new product.
Product To Clone	Type the name of the product you want to clone. Or open the details of the product you want to clone and then click New From Clone . In this case, the field is populated automatically.
External ID	Select an external ID.
Entire Product	Select this to clone the entire configuration of the product. When you select this all the checkboxes are automatically selected.
Product Details	This indicates that the products details of the products are cloned. This option is selected by default.
Categories	Select this to include the categories associated with the product.
Attributes	Select this to include the attribute groups and attributes associated with the product.
Pricing	Select this to include all the price list and price list item associated with the product.
Options	Select this to include the option groups and options associated with the product.
Product Collateral	Select this to include the media associated with the product.
Product Group	Select this to include the product group associated with the product. If you select this, the new product is added in the product group.

Option	Description
Rules	Select this to include the rules associated with the product. You can select which rule to include.

5. Click **Save**.

A new product is created.

Configuring Product Families

Product Family is a standard [Salesforce.com](https://www.salesforce.com) feature. You can use the Product Family picklist to categorize your products. For example, if your company sells both hardware and software, you can create two Product Families: Hardware and Software.

To begin using Product Families, you must:

- Customize a Product Family picklist
- Edit a Product and select an appropriate Product Family value

Customizing the Product Family picklist

You can customize the Product Family picklist to include the different categories of products you sell.

To customize the Product Family picklist

1. Go to **Setup > App Setup > Customize > Products > Fields**.
2. From Product Standard Fields, click **Product Family**.
3. From Product Family Picklist Values, click **New**. Add one or more picklist values with each value on its own line.
4. Click **Save**.

The Product Family picklist displays the values you entered.

For each product in your price list, edit the product and select the appropriate Product Family value.

Editing a Product to include Product Family

For each product in your price list, you need to edit the product and select the appropriate Product Family value.

You must have an existing product.

To edit a product to include Product Family

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the Products menu, click **Manage Products**.
3. Search and click the product to open the product details page.
4. On the **Details** tab, from Product Family, select an appropriate value.
5. Click **Save**.

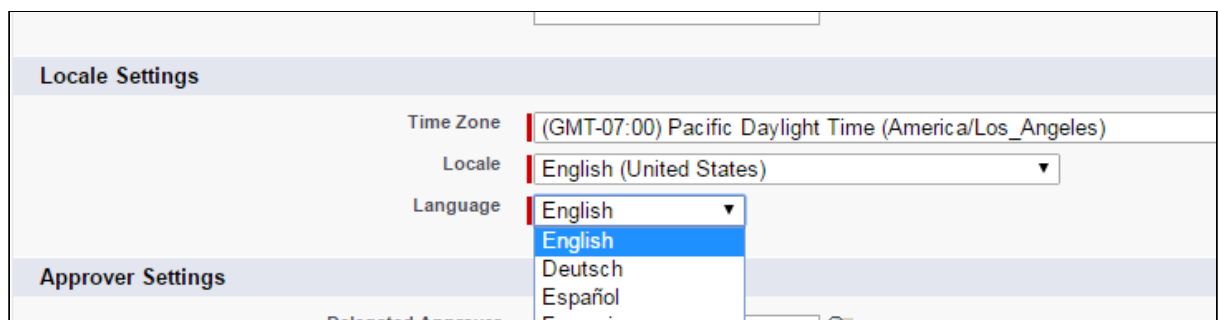

Based on your selection, your product becomes part of a Product Family.

Configuring Language Support for CPQ

Using this feature, you can display translated fields when the user belongs to a different locale. Multi Language support is available for Apttus out of the box field names, picklist values, button labels, and error messages.

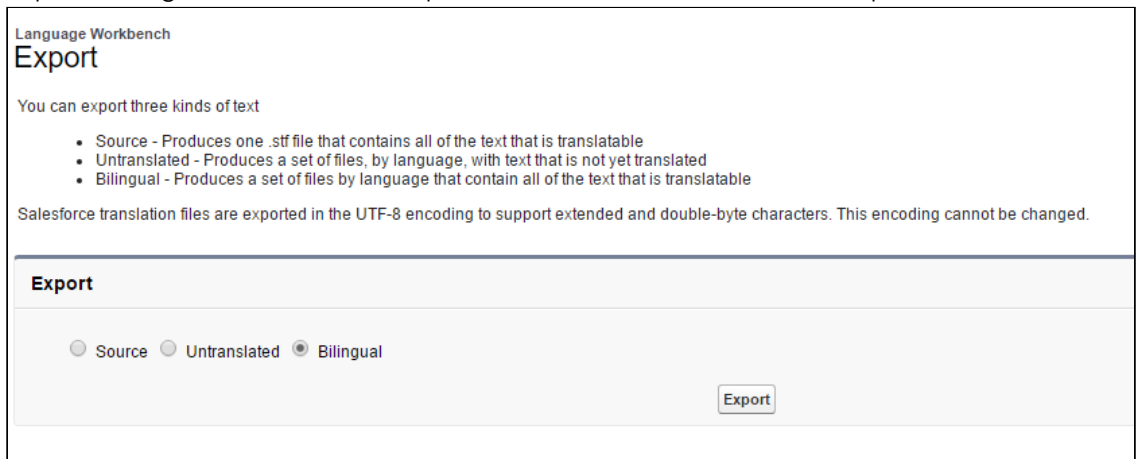

Configurations for translating content in another language

- To use Translation Workbench for translating the label data, go to **Setup > Administer > Translation Workbench > Translation Settings**. Click **Add** button and select the **Language** as *Japanese*. To change the language at the Profile level, go to **Setup > Users > Edit**. Under the **Locale Settings**, change the value in the **Language** field and click **Save**.

- To add translations for custom labels (i.e non-Apttus out of the box labels), you need to upload a new Salesforce Translation File (STF) through translation workbench.

- Export Bilingual STF from Setup > Translation Workbench > Export

- Translate STF (non-translated items will show up in English).
- Import Translation from Setup > Translation Workbench > Import.

Managing Categories and Hierarchies

Categories are high-level logical groupings of products, affecting the way the Sales rep sees them for selection on the Product Catalog. A category can be created for browsing products in the Catalog page or they can be created for creating options groups for a Bundle product. Products are associated to a category through a category hierarchy. Category hierarchies are maintained using the Hierarchy Manager. They are also used to group the total price of the products belonging in a category on the Cart Summary.

There are three types of category:

- **Offering:** An Offering is a collection of products that an organization makes available to a customer. A Bundle or a Standalone product can be associated with an Offering category. If you are creating a category hierarchy for the first time, you need to create a new category through this method only. Most implementations will have an existing hierarchy.
- **Offering and Option Group:** This category type groups products that can be used as a category and option group. For example, a keyboard can be sold as a standalone product and also as an option along with a bundle product (such as Desktop PC).
- **Option Group:** Option Groups categorize multiple option products. Option products are associated to option groups, and option groups are further associated to bundle products, thus associating option to a bundle product. You can manage option groups in **Manage Option Groups** menu.

The following topics provide instruction to manage Categories and Category Hierarchy.

- [Creating Categories](#)
Categories are created to group products for the end user's product selection. Categories are also used to group options within bundles.
- [Creating Category Hierarchies](#)
Categories are created when a hierarchy needs to be created for the first time. Hierarchy defines the structure of the product catalog.
- [Running a Category Maintenance Job](#)
After making any change to category definition, category to product association, or hierarchy change, you must run a Category Maintenance job. This de-normalizes the hierarchy into a custom object for reporting and totaling purposes. If category maintenance is not run, the end user may see incorrect hierarchy or totals on the cart page. Making changes to existing categories or category hierarchies requires you to run the Category Maintenance batch job to maintain the hierarchy and associations.

Creating Categories

The purpose of categories is to group products for the end user's product selection. Categories are also used to group options within bundles. Follow the steps below to create and modify a category.

To create a Category

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Click **New Category**. **Create New Category** pop-up is displayed.
4. Enter a mandatory **Name** and **Label**.
5. Select **Active** to activate the category. By default, the **Active** check box is already selected.
6. Select one of the following from the **Type** picklist.
 - *Offering*
 - *Offering and Option Group*

Only these two types are allowed for category creation. Option Group type is only available for option group creation on the **Manage Option Group** menu.

7. Click **Save**.

Based on your category type selection; an *Offering*, or an *Offering and Option Group* type category is created and added.

You can create category hierarchies based on your business requirement. Select a Parent Category when you create a new category.

To modify an existing Category

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Search and click the category to open the category details page.
4. Modify desired fields as required.

Field Name	Description
Name	Enter a name for the category.
Label	The label name is populated automatically.
Description	Enter a description of the category.
Default Search Category	When selected, Default Search Category displays the product by default under the category or sub-category in the catalog page. If not, the user has to first select the category from the category panel or the browse section to see the product.
Expanded By Default	Indicates that the hierarchy is expanded at all times in the catalog page
Include In Totals View	Indicates that the mode is displayed in the totals view on the shopping cart
Hide All Search Filters	Indicates that all the search filters in Narrow Your Search and Refine Your Search on the Catalog page are hidden.
Search Filter Fields	Selected filter fields are displayed in the Refine Your Search section. Select fields from the dropdown menu, click anywhere on the screen once selected all the desired fields.
Long Description	The Long Description is displayed for categories that have bundle products on the Options page.
Catalog's Image(s)	You can add an image like a symbol or an icon for the sub-category. Click Browse to select an image from your local machine.

5. Click **Save**.

The category is modified and saved. After creating or modifying the categories, you must run the [Category Maintenance batch](#) job.

Creating Category Hierarchies

Category hierarchy defines the structure of the product catalog. You can build and maintain a category hierarchy on the Category page. You can add sub-categories (also known as nodes) to a category, add an image, reorder categories, and associate products, thus building a hierarchy. Most implementations will have an existing hierarchy.

You can create multi-level categories. For example: **Home > Laptops > Model**.

Prerequisite

You must have an existing Offering category.

To build a Hierarchy

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Search and click the category to open the category details page.
4. The Category details page is displayed, which allows you to perform the following actions for the selected category.
 - Add or Edit a Sub-category
 - Remove a category
 - Associate Products
 - Reorder Categories
5. Click **Save**

A category hierarchy is built. The hierarchy is visible on the left-hand side of the Category Manager page. After building the hierarchy, you must run the [Category Maintenance batch job](#).In

In the following section:

Adding Sub-Categories

Sub categories (also known as nodes) categorize products within a category. You can add multiple sub-categories/nodes to categorize products within a category.

Before You Begin

You must have an existing top-level category.

To create a new sub-category within a Category

Note

You cannot add a sub-category to a category that has products associated to it.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Search and click the category you desire to be the parent category. The category details page is displayed.
4. Click **ASSOCIATED CATEGORY**. Click **New Category**. Or click **New Category** on the category details page. **Create New Category** pop-up is displayed.
5. On the **Create New Category**, check that the desired parent category is selected. Search or use arrow icons at the bottom to find the desired category.
6. Fill in the information as explained in the table below.

Field Name	Description
Name	Enter a name for the category.
Label	The label name is populated automatically.
Default Search Category	When selected, Default Search Category displays the product by default under the category or sub-category in the catalog page. If not, the user has to first select the category from the category panel or the browse section to see the product.
Expanded By Default	Indicates that the hierarchy is expanded at all times in the catalog page

Field Name	Description
Hide All Search Filters	Indicates that all the search filters on the catalog page in Narrow Your Search and Refine Your Search sections are hidden.
Include In Totals View	Indicates that the mode is displayed in the totals view on the shopping cart
Description	Enter a description of the category.
Long Description	The Long Description is displayed for categories that have bundle products on the Options page.
Upload Image	You can add a small image like a symbol or icon for the sub-category. Click Browse to select an image from your local machine.

7. Click **Save**.

The sub-category is created and added as a node to the hierarchy.

Removing Sub-Categories

You can remove a sub-category and its nested categories from the Associated Category page.

To remove a sub-category

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Search and click the category you desire to be the parent category. The category details page is displayed.
4. Click **ASSOCIATED CATEGORY**. All the associated sub-categories are listed on this page.
5. Click the remove icon() under the **Action** column for the sub-category you want to remove.
6. Click **Save**.

The sub-category is removed from the hierarchy.

Associating Products to a Category

Following the steps below you can associate products to a category at a category-level. You can also associate a product to a category from the product-level.

 You cannot associate products to a category with sub-categories associated to it.

To associate a Product to a Category

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Search and click the category to open the category details page. **DETAILS** tab opens by default.
4. Click **ASSOCIATED PRODUCTS**. If the category has sub-categories, **ASSOCIATED PRODUCTS** tab is not visible. In this Case, click **ASSOCIATED CATEGORY** and then select a sub-category. If you nested sub-categories, navigate to the last sub-category.
5. Drag and drop all the products you want to add in the category from the **All Product** list. You can search for the products using the search bar.
6. Click **Save**.

Your desired product is associated with a category.

Associating Categories to a Product

A product (standalone or bundle) must be associated to a category to be displayed on the catalog page.

This can be achieved at a category level or a product level. At the product level you can associate categories to a product and at the category level, you can associate products to a category. On the Products page and Category page, you can update and modify the categories and products respectively.

To associate Category to a Product

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click the product to open the product details page.
4. Click **ASSOCIATIONS**. Click the category hierarchy icon (). **Category Hierarchy** pane is displayed.
5. Drag and drop the desired Categories from **Category Hierarchy** pane. You can search for the categories using the search bar.
6. Click **Save**.

The product is now associated with a category.

 For performance implications, Apttus recommends that you limit the number of products in a single category to 1000.

Sequencing Products within a Category

You can use the `orderByClause` parameter to sequence the Products on the Catalog page. You can add a new field in the Product2 object (for example: as Category Rank) and set the `orderByClause` in this manner: `productOrderByClause=Category_Rank__C NULLS LAST, Name` while configuring a formula to launch the Product Catalog.

By default, the product list shown on the Catalog page is sorted by **Product Name**.

To sequence the Products on the Catalog page

1. Create a new custom field on Product2 object. For example: Category Rank.
2. From the Product Detail screen, assign the appropriate numeric value for this field.
3. Use the following formula to launch the ngCart.

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 ,HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=" &Id"&flow=ngFlow&productOrderByClause=Category_Rank__c NULLS LAST, Name" ,IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)
```

On the Catalog page, Products are displayed based on the sort order defined in the custom field.

Reordering Root Categories on the Catalog Page

Product managers can correctly sequence the root or top-level catalog categories to ensure that the right product lines are prioritized or that the most common categories are positioned first. The ordering can be different for different Price Lists. Price Lists drive the hierarchy that shows up in the catalog for a given quote.

To reorder or sequence the root categories (top-level categories on the catalog page)

The categories are associated with the category hierarchy and the category hierarchy is associated with a Price List for it to show up in the catalog.

1. In Salesforce Classic, go to the **Price Lists** tab.
2. Select a price list in which you want to reorder categories.
3. Under the related list for Categories, click **Edit** for the category that is related to your target root (top-level) category.
4. Update the **Sequence** fields with the desired number. Set the sequence number relative to other categories to drive the order (Object: Price List Category, Field: Sequence).

The screenshot shows the 'Price List Category Edit' form. At the top, there is a title bar with a yellow lightning bolt icon, the text 'Price List Category Edit', and the ID 'PL-0000001092'. Below this is a header section with the title 'Price List Category Edit' and three buttons: 'Save', 'Save & New', and 'Cancel'. The main body of the form is titled 'Information' and contains the following fields:

- Entry Id:** PL-0000001092
- Price List:** Price List
- Hierarchy:** Temp (with a search icon)
- Sequence:** 3

At the bottom of the form, there are three buttons: 'Save', 'Save & New', and 'Cancel'.

5. Click **Save**.

i You must edit the layout to include the field **Sequence** on the related list for Category and on the Price List Category Details page.

The order set by the sequence number for a given Price List should be the order in which the categories show up on the catalog page. You do not need to run the maintenance job after updating the sequence.

You also can rearrange the order of your categories or sub-categories within a hierarchy. Reordering of categories can be done from the leaf as well as root nodes. Leaf nodes are the level of categories between the top level category and the lowest node.

To re-order a sub-category

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Catalog**.
3. Search and click the category you desire to be the parent category. The category details page is displayed.
4. Click **ASSOCIATED CATEGORY**. All the associated sub-categories are listed on this page.
5. Drag and drop the sub-categories list in the section in the middle in the desired order.
6. Click **Save**.

The system updates the order and displays the hierarchy.

Running a Category Maintenance Job

When you create a category and associate products to the category or change the category definition, you must run a Category Maintenance job. If you do not run category maintenance, the Sales rep may see incorrect hierarchy or totals on the cart page.

After making changes to the existing category definition you can run the Category Maintenance batch job only for changes rather than running for the entire definition. For example, if your category has 10 products and you added 5 more, you can run the Category Maintenance batch job only for the 5 additional products.

Refer to [Running Maintenance Jobs](#) in *CPQ on Salesforce Administrator Guide*.

 You must run the Category Maintenance batch job after every CPQ version upgrade.

Managing Bundles

Bundled products represent a combination of standalone products that offer added values. An option group is used to combine product options and then associate that group to a bundled product.

In this section:

Creating Option Groups

Option groups are a type of category that is used to group option products together to be associated with bundles. Options group can also be used as categories.

There are two types of option groups:

- *Option Group*: Option Groups categorize multiple option products. Option products are associated to option groups, and option groups are further associated to bundle products, thus associating options to a bundle product.
- *Offering and Option Group*: This category type groups products that are of type Standalone and Option. For example: A keyboard can be sold as a standalone product and also as an option along with a bundle product (such as Desktop PC).

Option groups are further categorized into two types Shared Option Group and Standalone Option Group. You can create these option groups on the **STRUCTURE** tab on the products details page in CPQ Admin. All the option Group you create in the **Manage Options Group** menu are by default shared.

Shared Option Groups can be associated with multiple bundles. Whereas, Standalone Option Groups are bundle specific. Though, you can associate standalone options groups with other bundles. However, only the option group structure that you saved for the first time while creating the standalone option groups is associated with another bundle. The changes you make to the option group structure after saving the first time are not reflected whenever you associated the same option group with other bundles.

When you click **New Shared Option Groups** or **New Standalone Option Groups** a pop-up opens in which you create a new option group. Follow the steps in the *To create an Option Group* below to after you click **New Shared Option Groups** or **New Standalone Option Groups**. When you create an option group in the structure page of a bundle, that option group is automatically associated with the bundle. Shared option groups are also associated with the bundles. Any change structural changes you make are reflected on all

the bundles the shared option group is associated with. For example, if you change the options in the option group, the changes are reflected in all the bundles the shared option group is associated with.

To create an Option Group

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Option Groups**.
3. Click **New Option Group**. **Create New Option Group** pop-up is displayed.
4. Enter a mandatory **Name** and **Label**.
5. Select **Active** to activate the category. By default, the **Active** check box is already selected.
6. Select one of the following from the **Type** picklist.
 - *Option Group*
 - *Offering and Option Group*
7. Click **Save**.

Based on your **Type** selection; an *Option Group* or *Offering and Option Group* type options group is created and added.

You can create option group hierarchies based on your business requirement. Select a Parent Option Group when you create a new option group.

To modify an existing Option Group

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Option Groups**.
3. Search and click the option group to open the option group details page.
4. Modify desired fields as required.

Field Name	Description
Name	Enter a name for the options group.
Label	The label name is populated automatically.
Description	Enter a description of the options group.

Field Name	Description
Default Search Category	When selected, Default Search Category displays the product by default under the category or sub-category in the catalog page. If not, the user has to first select the category from the category panel or the browse section to see the product.
Expanded By Default	Indicates that the hierarchy is expanded at all times on the catalog page
Include In Totals View	Indicates that the mode is displayed in the totals view on the shopping cart
Hide All Search Filters	Indicates that all the search filters on the catalog page in Narrow Your Search and Refine Your Search sections are hidden.
Search Filter Fields	Selected filter fields are displayed in the Refine Your Search section. Select fields from the dropdown menu, click anywhere on the screen once selected all the desired fields.
Long Description	The Long Description is displayed for categories that have bundle products on the Options page.
Catalog's Image(s)	You can add an image like a symbol or an icon for the sub-category. Click Browse to select an image from your local machine.

5. Click **Save**.

The option group is modified and saved. After creating or modifying the options, you must run the [Category Maintenance batch](#) job.

 In the Salesforce Classic user interface select the **Cascade Group Changes** field on the Product Option Group details page to enable a warning message when you modify any shared option group.

Associating Options to an Option Group

You need to associate options with options groups to use them in a bundle.

Prerequisite

You must have an existing Option product and an Option Group category.

To Associate Options to Option Groups

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Option Groups**.
3. Search and click the options group to open the option group details page.
4. Click **ASSOCIATED PRODUCTS**.
5. Drag and drop all the options you want to add in the options group from the **All Product** list. You can search for the options using the search bar.
6. Click **Save**.

Option products are associated with an option group. Next, you must associate option group to a bundle product through an option group.

To Associate Options to Option Groups within a Bundle

1. On the **Manage Products** page, open the products details page of the bundle.
2. Click **Structure**.
3. Click the shortcut icon () under **New Shared Option Group** button. **Option Hierarchy** panel is displayed.
4. On the **Option Hierarchy** panel select a category from the dropdown menu.
5. Drag and drop desired option group and options from the **Option Hierarchy** pane.
6. Click **Save**.

 When you modify an option group that is associated with multiple bundles, all the associated bundles are affected.
Select the **Cascade Group Changes** field on the Product Option Group details page to enable a warning message when you modify any shared option group.

Associating Options to a Bundle

An Option is associated with a bundle product only through an Option Group to give the end user an additional choice for a product. To create an Option product, [create a new product](#) and from configuration type select Option. You must associate an Option Group

that contains Options to a Bundle. After associating Options to an Option Group, you must associate the option group to a Bundle.

Prerequisite

Has Options in the **Details** tab must be selected. Otherwise, **Structure** tab is not displayed. For more information refer to [Creating Products](#).

To Associate Option Groups to a Bundle

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click the bundle you want to associate options with.
4. Click **Structure**. The page displays all the options and option group associated with the bundle.
5. Click the shortcut icon () under **New Shared Option Group** button. **Option Hierarchy** panel is displayed.
6. On the **Option Hierarchy** panel, select Options Groups from the dropdown menu.
7. Search the option group using the search bar and then drag and drop the options group in the middle.
8. Click **Save**.

Options are now associated to the bundled product through an option group. You can associate the bundle product to a category or a price list.

You can choose to lock the option quantity value, which is populated using numeric expressions.

To Modify an Existing Option Group within a Bundle

1. On the **Manage Products** page, open the products details page of the bundle the option group is associated to.
2. Click **Structure** and select the option group you want to modify. Options of that options group are displayed in the middle section.
3. Fill in the required details as explained in the table below:

Field Name	Description
Content Type	<p>Options - Default value for Content Type is Options.</p> <p>Attributes - When content type is selected as Attributes, attribute group lookup filed is displayed.</p> <p>Detail page - When content type is selected as Detail page, the system will display the text field in which you can specify the detail custom page URL.</p> <p>Note: When you migrate data from one org to another using Data loader, ensure that you select Options value for the Content Type.</p>
Min Options	Specify the minimum product options which a user should select on the options page.
Max Options	Specify the maximum product options which a user should select on the options page.
Min Total Quantity	<p>Specify the minimum required value, inclusive of all the options inside an option group. For example, if you enter 10 in this field, the minimum quantity of all the options should reach 10. Thus, you can have 5 options, each with quantity=2.</p> <p>You can also use Numeric Expressions to populate this field. Ensure that the return value of your numeric expression is of type <i>Number</i>.</p>
Max Total Quantity	<p>Specify the maximum required value, inclusive of all the options inside an option group. For example, if you enter 10 in this field, the maximum quantity of all the options should reach 10. Thus, you can have 5 options, each with quantity=2.</p> <p>You can also use Numeric Expressions to populate this field. Ensure that the return value of your numeric expression is of type <i>Number</i>.</p>
Is Hidden	Select this check box if you want to hide this option group on the catalog page.

Field Name	Description
Is Picklist	Select this check box when you want to display your options in the form of a picklist, from which your user can select only one option. When you select this check box, ensure that Min Options and Max Options are set to 1.
Modifiable Type	Variable - Select this option if you want to allow the user to change the quantity of the option products during the configuration. Fixed - Select this option if you want to restrict the user from changing quantity of the option products inside this option group.

 Note that you should cautiously use the Min/Max option field in conjunction with hiding an option group. If no option products are visible due to Visibility rules configuration or different price lists, and you have set the minimum options as zero, the system considers this configuration as invalid.

To Modify an Existing Option Product inside a Bundle

1. On the **Manage Products** page, open the products details page of the bundle the option is associated to.
2. Click **Structure** and select the option group you want to modify. Options of that options group are displayed in the middle section.
3. Fill in the required details for an option as explained in the table below:

Field Name	Description
Min Quantity	Specify the minimum quantity for the specific option. You can also use Numeric Expressions to populate this field.
Max Quantity	Specify the maximum quantity for the specific option. You can also use Numeric Expressions to populate this field.

Field Name	Description
Default Quantity	Select the check box if you want to add a specific number of options to the bundle during configuration. You can also use Numeric Expressions to populate this field.
Default	Select the check box to mark this option as Default.
Quantity Modifiable	Select this check box to make the option quantity modifiable by the user on the Options and Cart page.
Allow Cloning	<p>Selecting this check box for specific product option, bundle or sub-bundle will show the clone icon next to the option on the configuration page while configuring the product. When you click this icon, the system will clone all associated attributes as is.</p> <div data-bbox="667 943 1426 1070" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Cloning is only allowed for option, bundle or sub-bundle with Max Quantity more than 1.</p> </div>
Required	Select the check box to mark this option as mandatory.
Auto Update Quantity	Select this check box to lock an option quantity when you have the option quantity being derived from a numeric expression. Selecting this check box will show the lock icon next to the Quantity field on the Catalog page to indicate you cannot modify the Quantity because it is derived through a numeric expression.
Config Type	<p>Choose if you want to display the options as inline or on a new Visualforce page. This is to ease the sales rep to configure the options on the same page or on a different configuration page. By default, <i>Inline</i> option is chosen for the new products, for both, options and attributes.</p> <p><i>Inline:</i> The attributes and options can be configured on the configuration page.</p> <p><i>New Page:</i> A wrench icon is displayed near the bundle or sub-bundle product which has to be configured. When you click this icon, a new page is opened for configuration of options and attributes.</p>

Field Name	Description
Inclusion Criteria	Specify the minimum product options that a user should select on the catalog page.

- You can define the fields mentioned in the table above for options individually or define for all the options at once using the edit icon () next to **Action**.
- Click **Save**.

Whenever you modify a bundle structure by adding or removing options or option groups, a message to execute the bundle maintenance batch job is displayed. If you are using Salesforce Classic, you must execute the bundle maintenance job. The bundle maintenance batch job is automatically executed in CPQ Admin. However, you must execute bundle maintenance batch job after mass changes. For more information, refer to [Running a Bundle Maintenance Batch Job](#).

To lock an Option value

Ensure that the quantity field derives its quantity from an expression built using the field expression builder.

- To lock an option quantity, navigate to the **Option Group**, choose your option and select **Auto-Update Quantity**.
- On selecting the check box, a lock icon appears next to Quantity, when you configure your Bundle from the **Catalog Page**. The user can click the lock icon next to an option, to ensure that any updates to the field from which its value is derived does not affect the value set the first time. You can lock the quantity field for an option product, whose quantity is populated based on multiple attribute values using the field expression builder. Once the user enters the attribute value on the **AttributeDetail3** page and clicks Next, the value for quantity is auto-populated.
- Select the option and click the **Lock** icon.
- Navigate back to the Attribute detail page and edit the attribute value, then click **Next**. Notice that the value of the Option does not change even though the attribute value has changed.

Configuring Multi-Level Bundles

Your business may require you to configure a bundle in a bundle. This offers increased control over product selection, as well as making it easier to select products because selecting one bundle full of products is easier than selecting those products separately.

Depending on your business needs, you can configure products that may contain multi-level bundles. In addition to the ability to handle many levels of sub-bundles (also known as inner bundles), some of the bundles and/or options may be ramps or tiered offerings. This feature takes into account multi-level bundles with the ability to also show ramps or tiers contained within the sub-bundles. You can also apply constraint rules to multi-level bundles.

This feature enables you to configure a bundle and also view what products are being added (along with its hierarchy) to your cart on the configuration page. The selected products appear in the **My Options** section on the left hand side of the configuration page. You can also view and understand what bundle and option group you are currently in and navigate to the parent or child/lower level bundle during the configuration. The catalog/product hierarchy navigation is similar to the catalog and the configuration page. The product hierarchy is displayed in tree view and list view on the configuration page. You can minimize/hide the tree view.

To configure sub-bundles on the configuration page, you must set up the **Select Bundle Options** Visualforce page. It is recommended that after making changes to any bundle product association, you must [run a bundle maintenance job](#) that synchronizes all the bundles and options.

 Changes done in option properties like MinQuantity, IsDefault do not require you to run bundle maintenance.

To set up select bundle options page

1. Go to **Setup > App Setup > Develop > Custom Settings**.
2. Click **Manage** for *Config System Properties*.
3. Click **Edit** for *System Properties*.
4. In **Option Page Default**, type one of the following based on your requirement.

Apttus_Config2__SelectConfigOptionsDetailView	Use this when there are usage tiers, ramps, and attributes for options products. This page does not support a large number of options on a bundle.
-----------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------

Apttus_Config2__ConfigureBundle	Use this when there are no usage tiers, ramps, and attributes for option products. This page supports more than 300 options on a bundle.
---------------------------------	------------------------------------------------------------------------------------------------------------------------------------------

5. Click **Save**.

The bundle options page is set up to display sub-bundles allowing you to configure a bundle in a bundle.

The next step is to run a bundle maintenance job.

i **Hyperlinks for Options Groups in the Summary Section**

- A summary section displays Option Group and child Option Groups with hyperlinks that takes you to the corresponding section wherein the entire configuration is shown.
- You must enable a custom setting Enable Hyperlink navigation in Bundle Summary to activate the hyperlinks. This setting is enabled by default.
- In New Admin UI, this setting is available under Display settings of Bundle Page.

Cloning a Bundle within the same Quote

You can clone a bundle within the same quote, make modifications, and use it as another bundle.

This feature enables you to clone a bundle with attributes, options, and pricing, make desired changes and save it as another bundle.

To clone a bundle within the same quote

You must have an existing bundle.

1. Select a bundle and click **Validate**. You can only clone a bundle.
2. Click  (Copy icon).
3. You can configure the bundle or make the desired changes and click **Validate**.

You have created another bundle from an existing bundle.

You can proceed to [Managing Pricing](#).

Running a Bundle Maintenance Batch Job

After making changes to any bundle product association, you must run a bundle maintenance batch that synchronizes all the bundles and options.

You can also use the **Update View** button from the Bundle and Option Manager page to run maintenance of view record for individual bundles. It is necessary to run maintenance when a new bundle or bundle options are added or removed. To make sure that all bundles have view records, use the **Bundle Maintenance** tab to run a bundle maintenance batch to update view records for all bundles. The bundle maintenance tab uses the Update Bundle Components page to run the batch.

 Changes made in option properties such as **MinQuantity** or **IsDefault** do not require you to run bundle maintenance.

Refer to [Running Maintenance Jobs](#) in *CPQ on Salesforce Administrator Guide*.

Managing Product Groups

You can create a logical grouping of one or more product records using Product Group. This construct allows you to create combinations of products with similar characteristics/qualities for use in a Price Rule. Product Group (as opposed to Product Family) can consist of products from different product families.

In order to configure a product group, you must create a product group and add products as members of the group. You can add products as members of a group. You can also add products of different product families as a member of a product group.

In this section:

Creating Product Groups

To Create a Product Group

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Product Groups**. Details first Product Group is displayed by default.
3. Click **New Product Group**.

4. In **Group Name**, enter a mandatory group name.
5. In **Description**, enter a brief description to describe the purpose of the group.
6. Click **Save**.

A product group is created and saved. After you have created a product group, you can add products as members of the group.

Associating Products to a Product Group

To Associate Products to Product Group

You must have an existing product group.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Product Groups**. Details of the first Product Group is displayed by default.
3. Search and click the product group to open the product group details page.
4. Click **Associated Products**.
5. Drag and drop all the products you want to add in the Product Group from the **All Product** list. You can search for the products using the search bar.
6. Click **Save**.

All the products added to the product group are displayed.

To Associate Products to Product Group Within a Product

You must have an existing product group.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Product**.
3. Search and click the product to open the product details page.
4. Click **Associations**. Click the Product Group icon(). **Product Group** pane is displayed.
5. Drag and drop the desired product groups from the **Product Group** pane. You can search for the product groups using the search bar.
6. Click **Save**.

The product is now associated to the product group.

You can view all the products that you associated with the product group listed in the center pane under the **Associated Products** tab on the Manage Product Groups page. Select a product from the list on the left-hand side pane and the list of associated products is displayed in the center. You can also search for a product from the list of associated products using the search box at the top of the center pane.

Creating and Maintaining Attributes

Attributes are used to associate certain features to a product. Examples of common attributes are color, size, weight, and more. Attributes are associated to a product either to drive pricing or simply stored for informational purposes against the line item for other purposes. Attributes are associated with products through Attribute Groups.

The Attributes administration page allows you to create and delete attribute groups that can be associated or disassociated with products. You can manage attribute groups and attributes associated to a product. You can also manage the sequence for associated attribute groups.

The subsequent chapters on this page explain the following functionalities:

Creating Product Attribute Fields

Product Attributes are used to associate certain features to a product. You must create product attribute fields in the Product Attribute Value object to represent an attribute. These attribute fields are then associated to a product through attribute groups.

To Create a Product Attribute Field

1. Go to **Setup > App Setup > Create > Objects**.
2. On the Custom Objects page, scroll down and select the **Product Attribute Value** object.
3. Scroll down to the **Custom Fields & Relationships** related list, and click **New**. You will be directed to the standard Salesforce field creation wizard.
4. Use the wizard to create a product attribute field, set up field dependencies, define workflow rules, line item validation rules, defaults, and more.

The Product Attribute field is created.

The next step is to create an Attribute Group and associate the product attribute field you created to the attribute group.

Creating Product Attribute Groups

Attribute groups are groupings of Product Attributes. Product Attribute fields must be associated to a Product Attribute group, which is to be associated to a product. Multiple product attributes can be grouped in a single Product Attribute group and a product can have multiple Product attribute groups associated to it.

Prerequisite

Select the **Has Attributes** checkbox. Clearing the **Has Attributes** checkbox disables the Configuration page.

To Create a Product Attribute Group

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click the product you want to associate attributes with.
4. Click **ATTRIBUTES**. The page displays all the attribute and attribute groups associated with the product.
5. Click **New Attribute Group** button. A pop-up is displayed.
6. Fill in the required details.

Field Name	Description
Group Name	Type a name for the Attribute Group
Two Column Attribute Display	Indicates that the configured attributes are displayed in two column format.
Three Column Attribute Display	Indicates that the configured attributes are displayed in three column format.
Description	Describe the attribute group.

7. Click **Save**.

Attribute Group are created and automatically associated with the product.

Associating Attribute Groups to a Product

You must associate an attribute group to a product for displaying the attributes (features) on the attributes page.

Prerequisite

1. Select the **Has Attributes** check box. Clearing the **Has Attributes** check box disables the attributes page.
2. You must have an existing product attribute group with product attribute field associated to it.

To Associate an Attribute Group to a Product

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click the product you want to associate attributes with.
4. Click **ATTRIBUTES**. The page displays all the attribute and attribute groups associated with the product.
5. Click the shortcut icon (<) under **New Attribute Group** button. **Attribute Groups** panel is displayed.
6. On the Attribute Groups panel, select *Attributes Group* from the dropdown menu.
7. Search the Attribute Group using the search bar and then drag and drop the desired Attribute Group in the middle.
8. Click **Save**.

An attribute group is associated with a product.

To Associate Attribute to Attribute Group

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click the product you want to associate attributes with.
4. Click **ATTRIBUTES**. The page displays all the attribute and attribute groups associated with the product.

5. Select an attribute group you want to associate attributes with. Details of that attribute group are displayed in the middle.
6. Click the shortcut icon (<) under **New Attribute Group** button. Attribute Groups panel is displayed.
7. On the Attribute Groups panel, select *Attributes* from the dropdown menu.
8. Search the Attribute using the search bar and then drag and drop the desired Attributes in the Product Attributes section.
9. Fill in the required details.

Field Name	Description
Attribute	This is fields populated automatically and is not editable.
Expression	Define an expression to defined criteria.
Is Read Only	Indicates that the value of the attribute is not editable. The user cannot edit the value.
Is Hidden	Indicates that the attribute is not displayed on the configuration page. However, the attribute is associated with the attribute group.
Is Primary	Indicates that the attribute is critical and the attribute will be displayed on the Installed Products page as a critical attribute.

10. Click **Save**.

Setting the Default Price from Attributes Using a Formula Field

You can add a formula field in the Product Attribute Value object and use it in a Price List Item to derive the Default Price from the attribute. On completing this, you no longer have to add the attribute to the attribute group and associate it with the product.

This way, you can make sure that this attribute doesn't show up in the configuration pages when the end user is going through the configuration process.

Configuring Product Visibility

When you go to configure products for a Quote/Proposal, you can control which products from the price list are visible on the catalog page.

The following table describes some scenarios through which you can control the product visibility on the catalog page.

Scenario	Functionality	Configuration Required
You want to ensure that the products having Red color are visible on the Catalog page.	Refine Your Search	Select Red check box in the color section in Refine your Search dialog box.
	Search Filters (CPQ)	Select the appropriate price list in the Inclusion Criteria; select <i>Color</i> from Field, <i>Equal to</i> from Operator, and <i>Red</i> from Value.
	Visibility Rules through Custom Classes. Refer to Product Filter Callback Class	Modify the custom callback class code to list the catalog products as <pre>global String getProductFilterExpr(CustomClass.ActionParams params) { return 'Color__c = \'Red\''; }</pre>

Scenario	Functionality	Configuration Required
<p>You want to ensure that the Bundle products having Red color and relevant Option products having Green color are visible on the Catalog page.</p>	<p>Search Filters (CPQ) and Visibility Rules through Custom Classes. Refer to Product Filter Callback Class</p>	<p>Select the appropriate <i>Price List</i> in the Inclusion Criteria; select <i>Configuration Type</i> from Field, <i>Equal to</i> from Operator, and <i>Bundle</i> as Value.</p> <p>Modify the custom callback class code to list the catalog products as</p> <pre data-bbox="944 654 1426 907"> global String getProductFilterExpr(CustomClass.ActionParams params) { return 'Color__c = \'Red\''; } </pre> <p>Modify the custom callback class code to list the option products as</p> <pre data-bbox="944 1034 1426 1326"> global String getOptionFilterExpr(CustomClass.ActionParams params) { return 'ComponentProductId__r.Color__c = \'Green\''; } </pre>

Product Visibility can be controlled in the following functionality.

About Refine Your Search

When you are selecting items from the Product Catalog, *Refine Your Search* enables you to narrow the list of products to those that match your search filter questions.

Search filters are associated with categories, so that the *Refine Your Search* questions may change when you select different product categories. The questions are also found on the product record, which is how the Product list gets refined. When you select an answer to a

question and that answer matches the answer on the product record, that product is included in the filtered Product list.

You can select multiple values from the picklist for refining your search. The search is restrictive and helps narrow down the result to show only the relevant data. The Product field value should contain the filter value. The search filter provides all possible values.

Use Case:

For example, if you select Asia and Europe from Regions drop-down menu, then products available in both these regions are shortlisted.

 For a product to be displayed it must match all of the selected *Refine Your Search* criteria.

To configure your system to use Refine Your Search you must complete the following:

Steps	Description
Configuring the Custom Fields	Two custom fields need to be created. The field for Search Attribute Values is used to provide the search question and answers, which will be associated with a category. The field for Products is used to have the same search question and answer values available on the product record.
Configuring Search Filter Fields	This makes the custom field available from the <i>Search Filter Fields</i> list in the Hierarchy Manager . This must be completed so that the custom field can be associated with a specific category.
Configuring Refine Your Search Options	This task associates the custom field with a specific category and adds it to the Refine Your Search window in the Product Selection page.
Selecting Search Field Values for a Product	So that using <i>Refine Your Search</i> provides useful and relevant filtering, you should select a value for each search field on a product record.

When you are selecting items from the Catalog page, *Refine Your Search* enables you to narrow the list of products to those that match your search filters. The system can [dynamically display only those filter values](#) that are based on the products associated with the selected category.

Configuring the Custom Fields

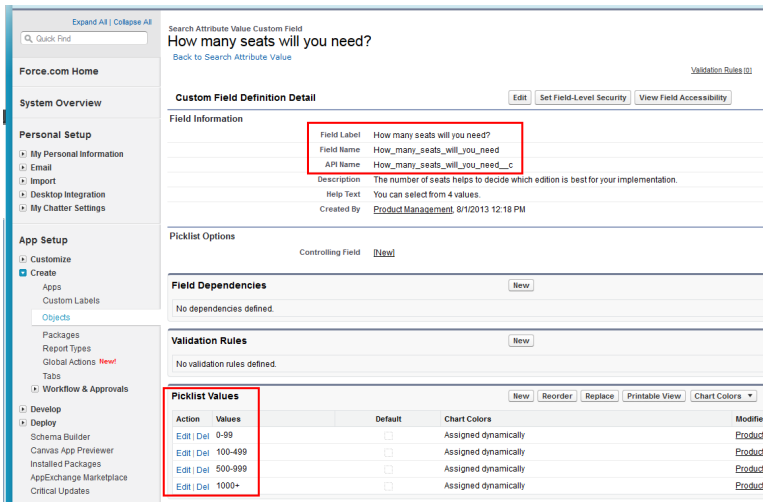

To configure the custom fields

1. Go to **App Setup > Create > Objects** and select **Search Attribute Value**.
2. Go to **Custom Fields & Relationships** and click **New**.
3. Select Picklist data type and click **Next**.
4. Enter the details:

Option	Description
Field Label	This is the question. This is the text that will be displayed in the <i>Refine Your Search</i> box when you are selecting your products. It is also displayed in the product's <i>Product Elements</i> section.
List of values	These are the answers. From the Product Catalog these are the options you can choose from to refine your search on the <i>Products</i> page. From the product record you can select one of these values for the product.
Field Name	This is the basis for the Salesforce API name, which is referenced in <i>Search Filter Fields</i> . The API name takes the field name and appends <code>_c</code> to it.
Description & Help Text	Standard Salesforce description and help text fields.

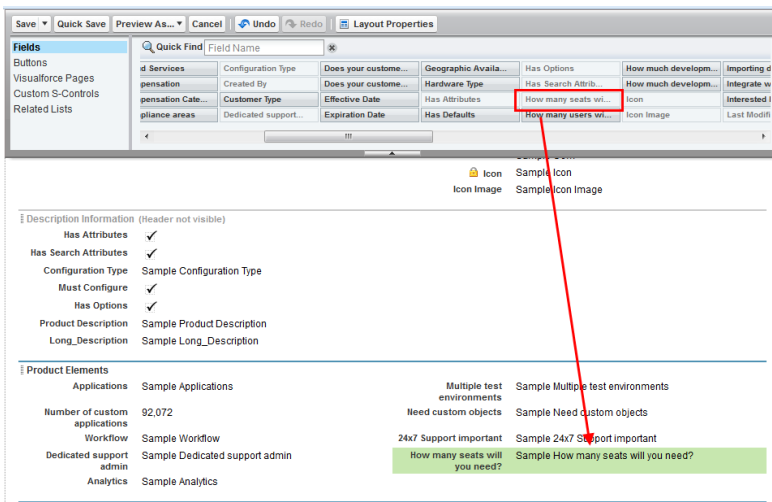

5. Click **Next**.
6. Select which profiles will have access to the field and click **Next**.
7. Ensure the field is added to available layout and click **Save**.

The new custom field is created and can now be associated with the Category Hierarchy search fields.

You must now complete the same task again, creating the same field label, values, and field name, but for Products. Go to App Setup > Customize > Products > Fields and then begin from Step 2.

If you want to change the default placement of the fields, you can reorganize them, by editing the page layout. To help group them together, typically the products custom field would be placed in a *Product Elements* section for the *Products* page layout.

Configuring Search Filter Fields

To configure search filter fields

The custom field must have already been created.

1. Go to App Setup > Create > Objects and select **Category Hierarchy**.
2. Scroll to **Custom Fields & Relationships** and select **Search Filter Fields**.
3. Scroll to Picklist Values and click **New**.

4. Enter the *API Name* for the custom field created in the *Search Attribute Value* custom object and click **Save**.

That field is added to the list and is now available in the Hierarchy Manager.

Edit Del	How_many_seats_will_you_need__c	

You can go to the Hierarchy Manager and add that field as a *Refine Your Search* question for specific categories.

Configuring Refine Your Search Options

To configure refine search options

You must have configured Search Attribute Value custom fields and Search Filter fields.

1. Go to **CPQ Console > Manage Categories** and select the category you want to have *Refine Your Search* questions for.
2. In the **Category Detail** section, click **Hierarchy Manager**.

- From the **Search Filter Fields** list, select the refine search filters you want to use and click .

- Click **Save**.

The next time someone goes to select products for that category, the selected search filter fields will be displayed.

When desired, you can return to the Hierarchy Manager to remove or add additional search filters.

Selecting Search Field Values for a Product

To select a search field value for a product

The custom search field must be available on the page layout used to display the products.

- Select a product.
- Click the search field question and select the appropriate value for the product.
- Click **Save**.

The value is displayed in the product record.

▼ Product Elements			
Applications	Full CRM	Multiple test environments	Yes
Number of custom applications	5	Need custom objects	200 or fewer
Workflow	No	24x7 Support important	No
Dedicated support admin	No	How many seats will you need?	500-999
Analytics	Customizable dashboards		

When that value is selected as a *Refine Your Search* answer, the product will be displayed in the refreshed Product list.

Configuring Refine Your Search with Dynamic Filter Values

When you are selecting items from the Catalog page, *Refine Your Search* enables you to narrow the list of products to those that match your search filters. The system now dynamically displays only those filter values that are based on the products associated with the selected category.

After you upgrade CPQ, you must run the Product Filter Maintenance task that collects all product field values related to a category. The product filter maintenance should be run when filter field association to the category changes or when the filter field values change in the product record. Also when new products are added or products are removed from a category you need to run the maintenance.

To run the Product Filter Maintenance task

You must have CPQ Summer13 SP5.5 installed.

1. Click  and click **Product Filter Maintenance**.
2. Click Update **Product Filters**.

The batch job is completed collecting all the product field values related to a category.

About Search Filters (CPQ)

When you configure products for a Quote/Proposal, you can control which products from the price list are visible on the catalog page based on search filters, where you set up the criteria of your choice.

For example, your company has 2 types of accounts in a quote, *Personal* and *Business*, and the products are of types *Personal*, *Business* or *Both*. You can define filters to display only products that are valid for the type of account on the quote. If the account type is *Business*, only the products that are of type *Business* or *Both* are displayed. In this scenario, you need to create 2 Search Filters.

Within a search filter, you can select the header level fields of object records as Entry Criteria for deciding whether a price list's products will be filtered to a certain subset of the full list. This subset also uses the header level fields of object records to determine which products are displayed.

The system checks whether a search filter is applicable to the price list you are using whenever you go to the product selection page. When you click **Configure Products** in the Quote/Proposal, the search filter is executed.

You can also apply the visibility rules for the categories displayed on the Catalog page. This functionality allows you to display only the relevant categories to a Sales rep who sells only a specific set of products from the large catalog. By hiding only the relevant category, you can still allow the Sales rep to search for the products and add to the Cart.

If you are hiding the product and its parent category, you need to configure two Search Filters, one for the product and another for category.

Each visibility rule type runs in sequence. The rule stops processing after the criteria for the first rule is satisfied. If multiple visibility rules on the product are satisfied, only the first rule gets executed. If one visibility rule on the product and one on the category is satisfied, both rules get executed, since they are of different types.

 For the Sales rep to see the Refine Your Search filters on the catalog page, ensure that you do not hide corresponding leaf categories. Refine Your Search that is applicable for the child category can only be used when such child categories are not made hidden through the Search Filter.

In this section,

Configuring Search Filter (CPQ)

You must follow the steps below in Salesforce Classic.

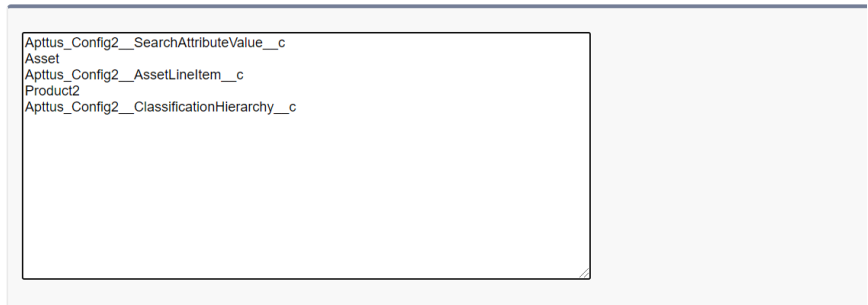

To Configure Business Object Field

1. Go to **Setup > App Setup > Create > Objects** and select **Search Filter (CPQ)**.
2. Select **Business Object** under the **Custom Fields & Relationships** section.
3. From **Values** section, Remove by clicking **Del**. This value must be deleted if it has not already been deleted.
4. Click **New** to add the following values in the picklist. Enter the API names of the objects you want to be able to use as a filter in separate lines. For example,
 - a. To define visibility for products add the following values.
 - *Apttus_Config2__SearchAttributeValue__c*
 - *Asset*
 - *Apttus_Config2__AssetLineItem__c*
 - *Product2*
 - b. To define visibility for categories add the following value.

- *Apttus_Config2__ClassificationHierarchy__c*

Add Picklist Values
Business Object

Add one or more picklist values below. Each value should be on its own line and it is used for both a value's label and API name.
 If a value matches an inactive value's API name, that value is reactivated with its previous label.
 If a value matches an inactive value's label but not the API name, a new value is created.

5. Click **Save**.

To Configure Filter Type Field

1. Go to **Setup > App Setup > Create > Objects** and select **Search Filter (CPQ)**.
2. Select **Filter Type** under the **Custom Fields & Relationships** section.
3. In the **Values** section, click **New** and enter the names you want to use to group the **Business Object** picklist values.
 - a. For Products
 - *Asset*
 - *Product*
 - b. For Category
 - *Category*
4. Click **Save**.
5. From **Field Dependencies** section, click **New**.
6. Select **Filter Type** from **Controlling Field** drop-down and select **Business Object** from **Dependent Field** drop-down.
7. Click **Continue**.
8. Select which business object fields should be associated with which filter. To select the Business Object value, double-click the value.

Showing Columns: 1 - 3 (of 3) < Previous Next > View All Go to		
Filter Type:	Product	Asset

	Apttus_Config2__ProductConfiguration__c	Apttus_Config2__ProductConfiguration__c
	Apttus_Config2__ProductAttributeValue__c	Apttus_Config2__ProductAttributeValue__c

Showing Columns: 1 - 3 (of 3) < Previous | Next > View All

9. Click **Save**.

The settings have now been configured so that you can create Search Filters (CPQ).

Creating Visibility Rules

Follow the steps below to create a visibility rule.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Visibility Rules**.
3. Click **New Visibility Rule** button. **DETAILS** page is displayed.
4. Fill in the information as explained in the table below.

Field Name	Description
Name	Enter a name for the visibility rule.
Filter Type	Select the type of filter you want to define. You can filter the products or category. This field determines the values in the Business Object dropdown.
Business Object	Select which object you to apply the filter on. This field controls the values available in the Filter Criteria field.
Value Object	Select which object you want to use to control the fields available for Inclusion Criteria .
Sequence	Enter a number to define a sequence in which the visibility rules are evaluated.
Description	Describe the visibility rule.
Active	Select the toggle button to activate the visibility rule.

Field Name	Description
Inclusion Criteria	<p>This is fields is visible after you select Value Object. Select the fields and expressions you want to use as entry criteria for the filter. You can use a maximum of three fields. If you use multiple fields, the relationship between them is an <i>AND</i> relationship, meaning each expression must evaluate as true. You can use Advanced Options to define a more complex formula.</p> <p>Click expression icon(). Click Add New Criteria. Fill in the following information to define an inclusion rule.</p> <ul style="list-style-type: none"> a. Row Num b. Field c. Operator d. Value <p>Click Save.</p>
Filter Criteria	<p>Select the fields and expressions you want to use to control which products will be visible when the Inclusion Criteria is met. You can have a standard <i>AND</i> relationship between the expressions or use Advanced Options to the fields together in a more complex formula.</p> <p>Click expression icon(). Click Add New Criteria. Fill in the following information to define an inclusion rule.</p> <ul style="list-style-type: none"> a. Row Num b. Field c. Operator d. Map To e. Value <p>Click Save.</p>

5. Click **Save**.

When someone goes to configure products, the products and the category that are visible to them will be limited to those defined by the Filter Criteria when the Inclusion Criteria is met.

Use Case: Configuring Category Visibility

To Display the Category Whose Name Starts with Hardware

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Catalog** menu, click **Manage Visibility Rules**.
3. Click **New Visibility Rule** button. **DETAILS** page is displayed.
4. Fill in the information as explained below.

Field Name	Description
Name	Enter a name for the visibility rule.
Filter Type	Select <i>Category</i> .
Business Object	Select <i>Category Hierarchy</i> .
Value Object	Select <i>Product Configuration</i> or <i>User</i> if you want to define inclusion criteria.
Sequence	Enter <i>1</i> as the sequence number.
Description	Describe the visibility rule.
Active	Select the toggle button to activate the visibility rule.
Filter Criteria	<p>Click expression icon(). Click Add New Criteria. Fill in the following information to define an inclusion rule.</p> <ol style="list-style-type: none"> Enter <i>1</i> in the Row Num. Select <i>Name</i> as a Field. Select <i>starts with</i> as an Operator. Specify desired category name as a Value. For example <i>Hardware</i>. <p>Click Save.</p>

5. Click **Save**.

Apttus CPQ displays only the categories that satisfy the criteria in the visibility rule on the Catalog page.

Configuring Product Comparison

You can enable a Sales rep to compare features of multiple products on the catalog page.

In order to configure product comparison on the catalog page, you must set up feature sets with one or more features. You must associate these feature sets to one or more products

and then define feature values for each product. The configuration allows you to enable or disable a product feature to be displayed during product comparison.

If you do not want to use the Compare Products Feature, you can hide the button from the Catalog page.

The following topics describe the instruction to configure the Product Comparison:

Setting Up Feature Sets

Feature sets are a collection of features that can be associated to a product.

You must first define a feature set and then define features for each set.

To create feature sets

1. Click **+** and click **CPQ Console**.
2. From the Product Management section, click **Add Feature Set**.
3. Type a mandatory **Feature Set Name**, and type a Description.
4. In the Feature Information section, type a **Feature Name** and a Description.
5. To add more than one feature, click **New**. A new row is added. The sequence number is auto-populated. You can rearrange the sequence by clicking and dragging the row.
6. Click **Save**.

A feature set is set up with features.

You must associate a feature set to a product for product comparison on the catalog page.

Associating Feature Sets to a Product

Using Product Console, you must associate a feature set to a standalone and a bundle product.

To associate a feature set to a product

You must have an existing product.

1. From the CPQ Console, click **Manage Products** and select an existing product to associate a feature set.
2. Click the **Product Console** button and scroll down to the Additional Data section, and click **Features**.
3. Click **Manage Associations** and from the Available Groups list, select a feature set for the association and click **Add**.

The feature set is associated with a product.

Define values for the features you just created.

Defining Feature Values for a Product

You must define the feature values for a given product.

To define feature values for a product

You must have an existing feature set and must be associated to a product.

1. On the Product Feature Values page, select the feature set listed in the left pane and type values next to the each feature.

2. To display the feature on the product comparison page, select **Is Included** and click **Save**.

Features Values that you just defined are saved.

Hiding Products Comparison

There is a custom setting that enables you to show or hide the *Compare Products* button and the product compare checkbox in the Catalog page.

After applying the new setting, you will no longer see the *Compare Products* button and the item level product compare check boxes.

To hide the compare products button on the catalog page

1. Click **+** and click **Config Settings**.
2. Click **Catalog Page Settings** and from the Product List Settings section, select **Hide Compare Products** to hide the compare products feature on the catalog page.
3. Click **Save**.

The compare products feature is not displayed on the catalog page.

Configuring Numeric Expressions

Numeric expression is the extended custom implementation of SFDC formula builder, which is fine tuned by Apttus. Numeric expression follows the syntax of SFDC formula and it provides all logical, text, date & time, math functions along with standard arithmetic operations. Note that numeric expression works for number fields.

Where you can use numeric expressions?

- To set the attribute value
- To set the minimum, maximum, and total quantity at the option group level
- To set the minimum, maximum, and default quantity at the option group level
- To define numeric rollups at product, product group, and cart level
- To set line item fields of auto-included products through constraint rules
- To set the criteria of product attribute rule (PAR)

i The Apttus Expression builder feature is disabled by default. To enable this feature, click **Custom Settings > Config System Properties > System Properties > Enable Field Expressions**.

Use Case:

Consider a requirement to configure a Home Solar Power starter bundle for SunHome. This product converts sun light on the panels into electricity for a small household. The bundle auto-includes two key components:

- 80-100 watt Solar Panels
- 12v @ 105 AH batteries

To find the right quantities of the panels and the batteries required, you must note the electricity usage to calculate the Total daily WattHours and Battery Capacity you require. The bundle also requires the calculated number of wires to be selected where the wiring length can vary based on the site study. The derivation is:

Summary of Usage	
Refrigerator Run Time (hrs per day)	8
Microwave Run Time (hrs per day)	0.50
Television Run Time (hrs per day)	4
House Lights (hrs per day)	3.00
Summary of WattHours required	
Total daily WattHours required	= Refrigerator run time * 140 + Television Run Time * 120 + Microwave run time * 1000 + House Lights * 200
WattHours required for 3 days	= Total daily WattHours required * 3
Battery capacity (50% discharge)	= WattHours required for 3 days * 0.50

To meet this requirement, you must create:

- *Summary of Usage* attribute group, which contains attributes such as Refrigerator Run Time, Television Run Time, and Microwave Run Time, and receives inputs from the user.
- *Summary of WattHours required* attribute group, which contains attributes that derive the values from the attributes above, using the numeric expression builder.
- SunHome included component option group, which contains options that derive the default quantity from the attributes of the *Summary of WattHours required*, using numeric expression builder.

Using the expression builder, you can create numeric expressions to complete the following tasks.

- Populate product attribute values
- Set the min/max quantity for any option and option group
- Set the default quantity or the min/max quantity for any bundle option

To configure numeric expressions, you must complete the following processes.

Populating Product Attribute values Using Numeric Expression

Create a product with attributes. You can use these attribute values to create a numeric expressions.

Example

SunHome is a product with the following attributes:

- Refrigerator Run Time
- Microwave Run Time
- Television Run Time
- House Lights

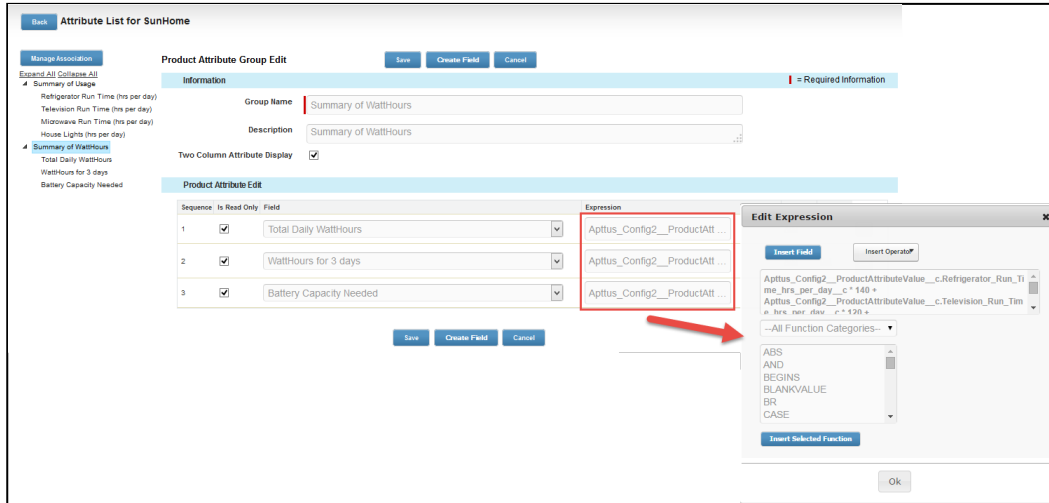

Each attribute has the datatype defined as number. You must also create an attribute group named *Summary of WattHours required* and assign it to the product SunHome. The attribute group contains the following attributes.

- Total daily WattHours required
- WattHours required for 3 days
- Battery capacity

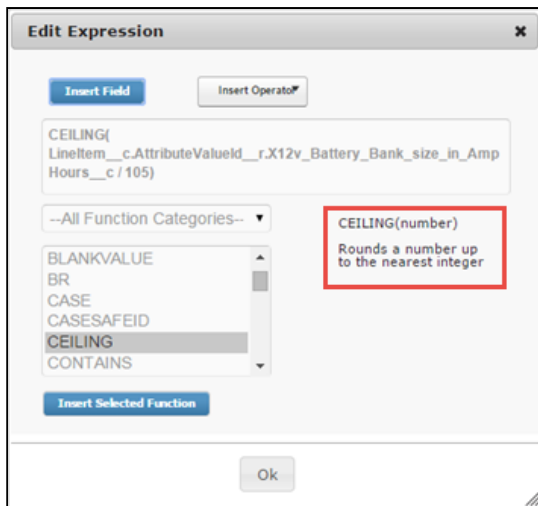

Each attribute has the datatype defined as number. You can derive the values for these attributes using numeric expressions.

To populate product attribute values using numeric expressions

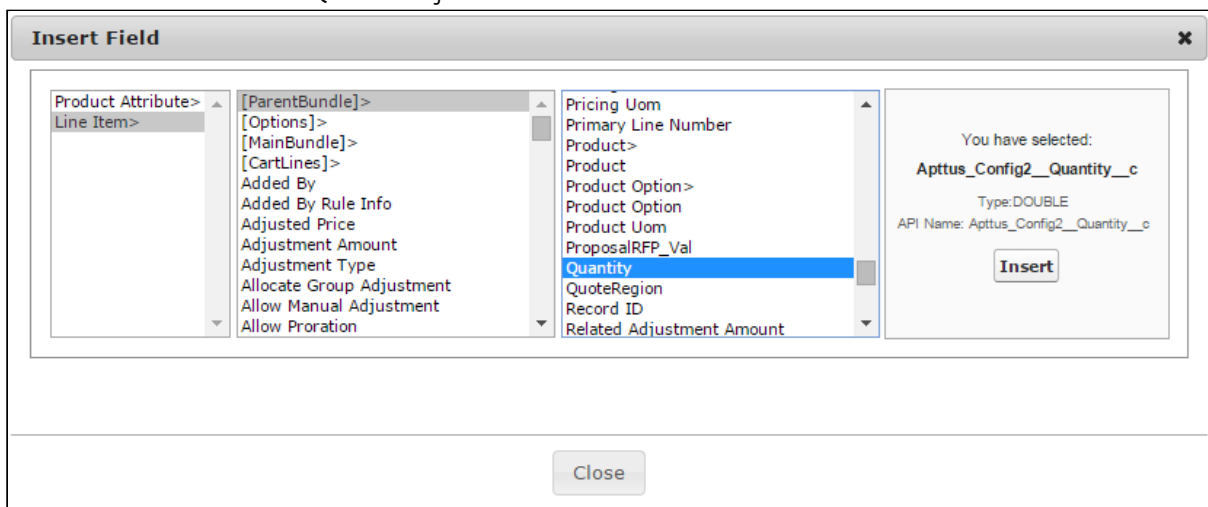

1. From the Products detail page, select SunHome and click **Product Console**.
2. Scroll down to the Additional Data section, and click **Attributes**.
3. Click **Summary of Watthours** required Attribute Group. All the attributes listed under the attribute group are displayed.
4. To associate an expression to an attribute, click the text field next to the attribute in the Expression Column. An expression builder pop up is displayed.

Selecting any function displays the example syntax on the right on how you can use it.

5. Click **Insert Field**. To retrieve the fields for building the expression, click Insert Field and choose Product attributes or Line Item. Line Item allows you to get access to fields at Product and Quote objects as well.

6. In the Insert Field dialog, click **Product Attribute** and select the required attributes to derive the values for attributes of SunHome. The following expressions are built for each attribute:

- Total daily WattHours required:

$\text{Apttus_Config2_ProductAttributeValue_c.Refrigerator_Run_Time_hrs_per_day_c} * 140 +$

$\text{Apttus_Config2_ProductAttributeValue_c.Television_Run_Time_hrs_per_day_c} * 120 +$

$\text{Apttus_Config2_ProductAttributeValue_c.Microwave_Run_Time_hrs_per_day_c} * 1000 +$

$\text{Apttus_Config2_ProductAttributeValue_c.House_Lights_hrs_per_day_c} * 200$

- WattHours Required for 3 days:

$\text{Apttus_Config2_ProductAttributeValue_c.Total_Daily_WattHours_c} * 3$

- Battery Capacity Needed (50% Discharge):

$\text{Apttus_Config2_ProductAttributeValue_c.WattHours_for_3_days_c} * 0.5$

 For more common syntax examples, see [Examples and Related Syntax for Numeric Expressions](#).

7. Click **Save**.

The expressions are built and the product attribute fields are populated with the value that the expression retrieves.

 After completing this process, you must run the Criteria Maintenance job for all expression fields. Refer to

Populating Option Group Min/Max Quantities Using Numeric Expression

Configure options for a product

1. Select the product that you want to assign numeric field expressions to.
2. Click **Product Console**, scroll down to the Catalog section, and click **Manage Bundles/Options**.

- To associate an expression to min/max total quantity of an option group, select an **Option Group**.

- Select one or both of the following fields to add an expression.
 - Min Total Quantity
 - Max Total Quantity

The expression builder opens.

- Click **Insert Field**. To retrieve the fields for building the expression, click **Insert Field** and choose Product attributes or Line Item. Line Item allows you to get access to fields at Product and Quote objects as well. Ensure that the return value of your numeric expression is of type *Number*.

For our SunHome Product, we can use this to enforce minimum quantity selection for the option group *Wiring*.

- ✓ For more common syntax examples, see [Examples and Related Syntax for Numeric Expressions](#).

- Click **Save**.

The expression is built and the option group quantity field is populated with the value that the expression retrieves.

- ⓘ After completing this process, you must run the Criteria Maintenance job for all expression fields. Refer to

Populating Option Default and Min/Max Quantity Using Numeric Expression

You must have an existing option product. You must also create an attribute group named *Summary of WattHours required* for SunHome. Following is a list of attributes in the group:

- Total daily WattHours required

- WattHours Required for 3 days
- Battery capacity

Each attribute has the data type defined as number. You must derive the values for options using numeric expressions. You must also create an option group with the options. Based on our scenario, this section outlines the procedure for an option group SunHome Component Quantity with options, Number of Solar Panels and Number of Batteries whose values are derived from the attributes above.

1. Navigate to the SunHome product, and click **Product Console**.
2. From the Catalog section, click **Manage Bundles/ Options**.
3. To associate an expression to an option, expand the Option Group, select an Option for which you want to add a field expression.

4. To add an expression, click one or more of the following:
 - Min Quantity
 - Max Quantity
 - Default Quantity

The expression builder pop up appears.

5. Click **Insert Field**. To retrieve the fields for building the expression, click Insert Field and choose Product attributes or Line Item. Line Item allows you to get access to fields at Product and Quote objects as well.
6. To derive the values for the options of SunHome, in the Insert Field dialog, navigate to Product Attribute. The expressions built for each of the options are as follows:

- Battery:

$$\text{CEILING}(\text{Apttus_Config2_LineItem_c} \Rightarrow \text{ParentBundle.Apttus_Config2_AttributeValueId_r.Battery_Capacity_Needed_c} / (12 * 105))$$
- Solar Panel:

$$\text{CEILING}(\text{Apttus_Config2_LineItem_c} \Rightarrow \text{ParentBundle.Apttus_Config2_AttributeValueId_r.Total_Daily_WattHours_c} / (90 * 5))$$

$$\text{Total_daily_WattHours_required_c, 0) / (90 * 5)}$$

✔ For more common syntax examples, see [Examples and Related Syntax for Numeric Expressions](#).

7. Click **Save**.

The expressions are built and the option quantity field is populated with the value that the expressions retrieve.

i After completing this process, you must run the Criteria Maintenance job for all expression fields. Refer to [Running the Criteria Maintenance Job for Expression Fields](#).

About Manage Field Expressions Page

The Manage Field Expressions page in the CPQ Admin user interface holds all the existing field expressions that you created. You can search, open, update, or create field expression from the Manage Field Expressions page. In CPQ Admin, Go to the **Products** tab and from the dropdown click **Manage Field Expressions**. A list of all the existing field expressions is displayed with the fields **Name**, **Active**, **Update Field** and **Is Modifiable**. There are various functionalities available for you to manage field expression.

Field Expression Details

You can search for a field expressions on the Manage Field Expressions page using the **Search Field Expressions** bar. You must search using any keyword that the field expressions name contains. Click the name of the field expression to view the related information on the Details page. The fields like **Name**, **Update Object**, **Update Field**, **Value Expression** and, **Operator** are displayed on the Details page. You can update the field expressions on this page as well.

New Field Expressions

You can create new field expressions using the **New Field Expression** button on the Manage Field Expressions page and Details page of the Field Expressions.

To create new field expressions

Follow the steps below to create a new field expression.

1. Click **New Field Expression**. The Details page is displayed.
2. Fill in the following information in the fields displayed on the Details page. Because you are creating field expressions from the Manage Field Expressions page, only the values relevant to field expressions are displayed in the dropdown of the fields listed below.

Field	Description
Name	Enter the name of the field expression
Active	Toggle the button to the right-hand side to activate the field expression
Is Modifiable	Toggle the button to the right-hand side to enable editing of the field expression
Expression Type	This field is populated by default with the value <i>Field update</i> .
Expression Context	Select the value <i>Record Update</i> from the dropdown.
Source Object	Select the value <i>Line Item</i> from the dropdown.
Scope	Select one of the following values that are displayed in the dropdown: <ul style="list-style-type: none"> • <i>Header Level</i>: to apply field expression on fields at header level • <i>Product</i>: to apply field expression on the product line items • <i>Product Group</i>: to apply field expression on the product group level.
Filter Expression	Enter the filter expression. Use the expression builder to create a formula.
Update Object	Select one of the following objects that are displayed in the dropdown: <ul style="list-style-type: none"> • <i>Line Item</i> • <i>Product Attribute</i>
Update Field	Select the field on which you want to apply the field expression.
Operator	Select an operator from the dropdown.
Value Expression	Enter the value expression. Use the expression builder to create a formula.

3. Click **Save**.

4. Click the menu icon () next to the **New Field Expression** button. Click **Update Field Expression Criteria Fields** to execute the batch job.

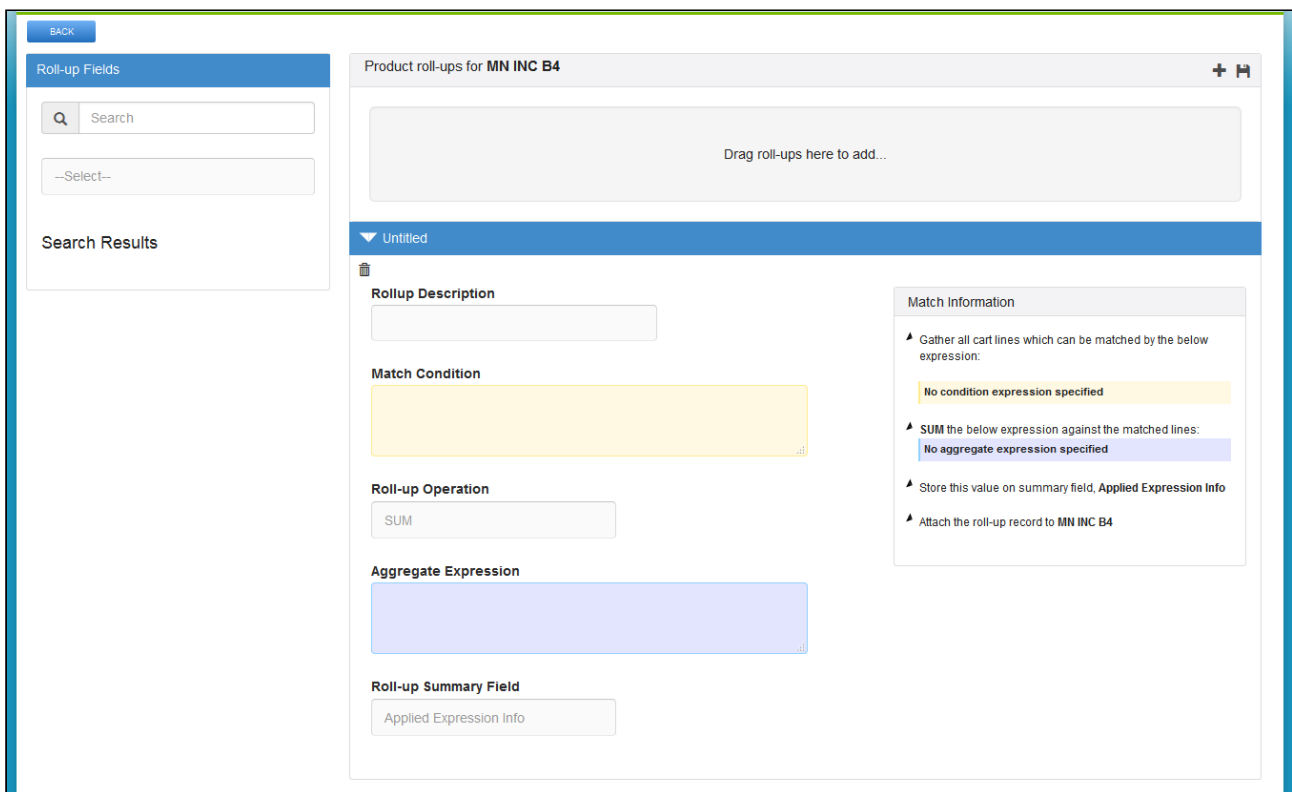

Running the Criteria Maintenance Job for Expression Fields

You must have existing field expressions.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. Click the menu icon() on the main menu bar at the top.
3. Click **Criteria Maintenance**. The Criteria Maintenance popup is displayed.
4. Click the **Update Expression Fields** button. This might take some time to update all expression criteria fields.
5. Close the Criteria Maintenance popup after the update is complete.

Creating Numeric Roll-Up Summary Fields for Objects

A Roll-up Summary Field can be defined at the Cart level or at a Bundle Product Level to aggregate value from each line item in the given context and with a match condition to filter out unwanted lines.

The screenshot shows the 'Criteria Maintenance' interface for creating a numeric roll-up summary field. The interface is divided into several sections:

- Roll-up Fields:** A sidebar on the left with a search bar and a dropdown menu labeled '--Select--'. Below it is a 'Search Results' section.
- Product roll-ups for MN INC B4:** A main header area with a '+ H' icon and a large grey box containing the text 'Drag roll-ups here to add...'
- Untitled:** A blue header for the configuration area.
- Rollup Description:** A text input field.
- Match Condition:** A large yellow text area for defining the match condition.
- Roll-up Operation:** A dropdown menu currently showing 'SUM'.
- Aggregate Expression:** A large blue text area for defining the aggregate expression.
- Roll-up Summary Field:** A dropdown menu currently showing 'Applied Expression Info'.
- Match Information:** A panel on the right showing the configuration details:
 - ▲ Gather all cart lines which can be matched by the below expression:
 - No condition expression specified
 - ▲ SUM the below expression against the matched lines:
 - No aggregate expression specified
 - ▲ Store this value on summary field, **Applied Expression Info**
 - ▲ Attach the roll-up record to **MN INC B4**

The **Match Condition** area enables you to enter an Expression created using the Expression Builder that establishes which line items will be filtered and have a Roll-Up.

The **Operator** defines the operation performed on all the aggregated line item values.

The **Aggregate Expression** is an Expression created using the Expression Builder that specifies the value to be rolled-up.

The Roll-up is by default created at the Cart level unless you add the following to the Match Condition:

ParentLineNumber = \$scope.LineNumber

This retrieves all the options for the bundle line in the aggregation. You can use this expression to aggregate values at an individual bundle level in order to drive a bundle configuration rule.

The Expressions can be built for any line item field, product field, and attribute value fields. These Roll-Up Fields can be further used for multiple functions such as building other Expressions, Assign default quantities, attributes values.

Roll-up Field Name	Return Type	Roll-Up Operation	Match Condition	Aggregate Expression	Object
Total Quantity	Number	SUM	IsPrimaryLine = TRUE	Quantity	Line Item
Total Weight	Number	SUM	Product.Type = Hardware	Quantity * Product.UnitWeight	Line Item
Bundle Heat Dissipation	Number	SUM	ParentLineNumber = \$scope.LineNumber && IsPrimaryLine = TRUE	Quantity * Product.UnitHeatDiss	Line Item
Lowest Setup Fee	Currency	MIN	ChargeType = 'Setup Fee'	ListPrice	Line Item
Max Line Item Discount	Percentage	MAX	ALL	NetAdjustment	Line Item
Avg Cost	Currency	AVG	ExtendedCost>0	ExtendedCost	Line Item

⚠ Extensive use of rollups at quote level may have performance implications for a cart with more than 20 product line items. It is also recommended to limit numbers of quote level rollups to below 20.

ℹ You can model your numeric expressions at the configuration level so that can rollup custom fields at the deal level. Rollups on configuration can be set through `Apttus_Config2_LineItem_c.$Config.$Rollups` (but does not return any value in client mode).

To create roll-up summary field

Create a custom Salesforce field in Roll-up Summary Object. Ensure that the field is unique and multiple expressions are not used to populate the same field. This field comprises or holds the value derived from the aggregate expression in the Field Expression builder.

- You can invoke the field expression builder for:
 - Bundles: To define a rollup field for a particular bundle, navigate to the Products tab, search and select a product and click Product Console.
 - Quote or Product Groups: To define a rollup field for a product group or at header level, navigate to the CPQ Console tab.
- Click **Rollups** from the Additional Details section.
- Click **+** to add a new rollup field for a product.
- Expand the Untitled section by clicking the right-facing arrow.

The screenshot shows the configuration interface for a roll-up summary field. On the left, there is a 'Roll-up Fields' sidebar with a search bar and a 'Search Results' section. The main area is titled 'Product roll-ups for MN INC B4' and contains a 'Drag roll-ups here to add...' placeholder. Below this is an 'Untitled' section with the following fields:

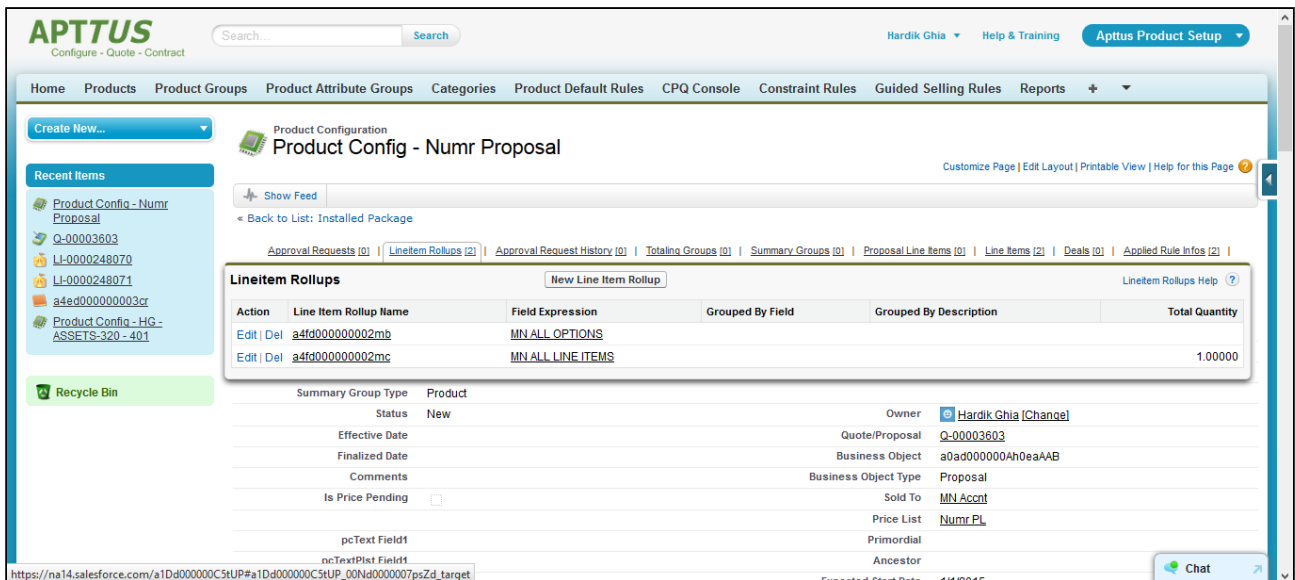

- Rollup Description:** An empty text input field.
- Match Condition:** A yellow text input field.
- Roll-up Operation:** A dropdown menu with 'SUM' selected.
- Aggregate Expression:** A blue text input field.
- Roll-up Summary Field:** A dropdown menu with 'Applied Expression Info' selected.

On the right side, there is a 'Match Information' panel with the following details:

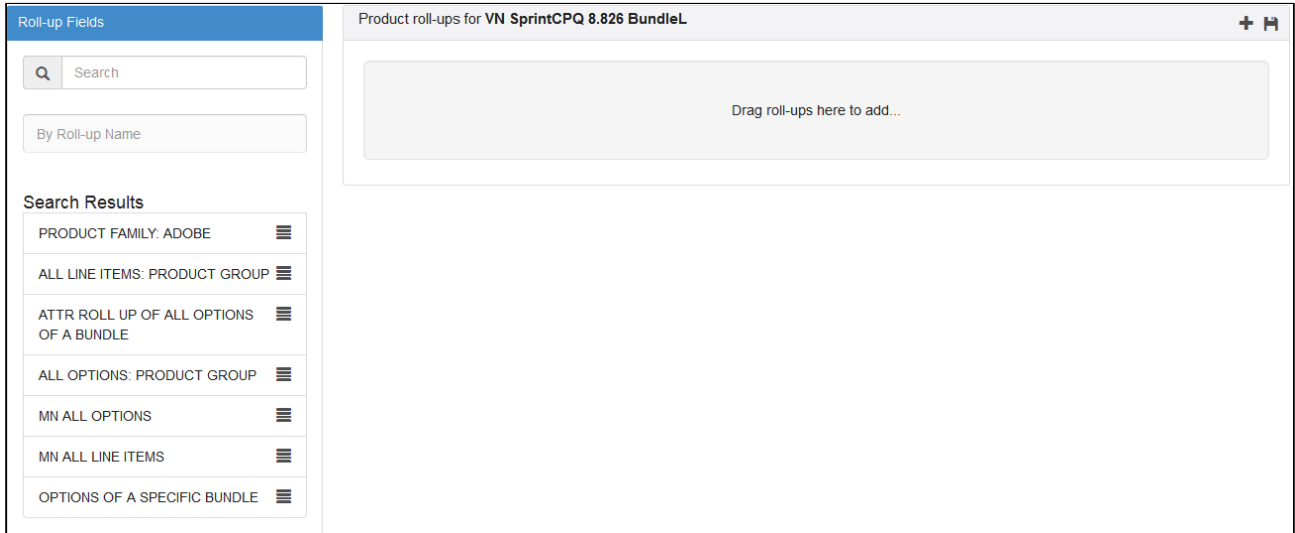

- Gather all cart lines which can be matched by the below expression:** A yellow box with the text 'No condition expression specified'.
- SUM the below expression against the matched lines:** A blue box with the text 'No aggregate expression specified'.
- Store this value on summary field, Applied Expression Info**
- Attach the roll-up record to MN INC B4**

5. Select the Rollup Summary field created on the Rollup Summary object.
6. In the Match Conditions area, specify the expression based on which the results are filtered. The numeric expression rollup is applicable only for those line items that satisfy the criteria in the Match Conditions area.
7. From the Roll-up Operation area, select an operation based on which the rollup is created.
8. In the Aggregate expression area, specify the expression based on which the value is populated in the Rollup Summary Field. For example, $(Quantity_c * ProductId_r.Weight_c) * 2$ Based on the Aggregate expression values, the rollup summary field is populated. Data is populated in The Match Information area based on the information you enter in all the above steps.
9. Click the **Save** icon in the top right corner of your screen.

The rollup for a product is created successfully. You can navigate to the cart page and check whether the rollup is applied successfully.

After you create rollup fields for a product, you can re-use the rollups across products or within the same product by searching for the rollup, product, or product group name in the Search field. Drag and drop the requisite roll-up conditions that you want to use to the right greyed out pane.

About Manage Rollups Page

The Manage Rollups page in the CPQ Admin user interface holds all the existing rollup type numeric expressions that you created. You can search, open, update, or create rollups from the Manage Rollups page. In CPQ Admin, Go to the **Products** tab and from the dropdown click **Manage Rollups**. A list of all the existing rollups is displayed with the fields **Rollup Name**, **Active**, **Update Field** and **Is Modifiable**. There are various functionalities available for you to manage rollups.

Rollup Details

You can search for a rollup on the Manage Rollups page using the **Search Rollups** bar. You must search using any keyword that the rollup name contains. Click the rollup name to view the related information on the Details page. The fields like **Name**, **Update Object**, **Update Field**, **Value Expression** and, **Operator** are displayed on the Details page. You can update the rollups on this page as well.

New Rollups

You can create new rollups using the **New Rollup** button on the Manage Rollups page and Details page of the rollups.

To create new rollups

Follow the steps below to create new rollups.

1. Click **New Rollup**. The Details page is displayed.

- Fill in the following information in the fields displayed on the Details page. Because you are creating rollups from the Manage Rollups page, only the values relevant to rollups are displayed in the dropdown of the fields listed below.

Field	Description
Name	Enter the name of the rollup
Active	Toggle the button to the right-hand side to activate the rollup
Is Modifiable	Toggle the button to the right-hand side to enable editing of the rollup
Expression Type	This field is populated by default with the value <i>Rollup</i> .
Expression Context	Select the value <i>Rollup</i> from the dropdown.
Source Object	Select the value <i>Line Item</i> from the dropdown.
Scope	Select one of the following values that are displayed in the dropdown: <ul style="list-style-type: none"> • <i>Header Level</i>: to apply rollup on fields at header level • <i>Product</i>: to apply rollup on the product line items • <i>Product Group</i>: to apply rollup on the product group level.
Filter Expression	Enter the filter expression. Use the expression builder to create a formula.
Update Object	This field is populated by default with the value <i>Line Item Rollup</i>
Update Field	Select the field on which you want to apply the rollup.
Operator	Select an operator from the dropdown.
Value Expression	Enter the value expression. Use the expression builder to create a formula.

- Click **Save**.
- Click the menu icon () next to the **New Rollup** button. Click **Update Field Expression Criteria Fields** to execute the batch job.

Examples and Related Syntax for Numeric Expressions

This section lists out the common examples and related syntax that you can refer to for your specific scenario.

- Syntax to fetch quantity of any product line selected for the quote:

```
Apttus_Config2__LineItem__c.$CartLines['Apttus_Config2__ProductId__r.Name','Product A'][0].Apttus_Config2__Quantity__c
```

Insert Field > Line item > CartLines > Select the field and provide the filter and index.

- Syntax to fetch sibling option quantity within the same parent bundle:

```
Apttus_Config2__LineItem__c.$ParentBundle.$Options['Apttus_Config2__OptionId__r.Name','Solar Panel 80-100 Watt'][0].Apttus_Config2__Quantity__c
```

Insert Field > Line item > ParentBundle > Options > Select the field and provide the filter and index.

- Syntax to retrieve product field value as part of an expression:
 - Retrieving a bundle product field

```
Apttus_Config2__LineItem__c.Apttus_Config2__ProductId__r.Numr_Numb__c
```

Insert Field > Line item > Product > Select the field

- Retrieving an Option product field when the expression is created for a bundle product.

```
Apttus_Config2__LineItem__c.$Options[field,value][index].Apttus_Config2__OptionId__r.Numr_Numb__c
```

Insert Field > Line item > ParentBundle > Options > Select the field and provide the filter and index.

- In Bundle-In-Bundle setup, if you want to update an option product's attribute, min quantity, and max quantity based on a field value from its bundle product which is an option of another bundle.

```
Apttus_Config2__LineItem__c.  
$ParentBundle.Apttus_Config2__OptionId__r.Numr_Numb__c
```

In Bundle-In-Bundle setup, if you want to update an option product's attribute, min quantity, and max quantity based on a field value from the top bundle product.

```
Apttus_Config2__LineItem__c.  
$MainBundle.Apttus_Config2__ProductId__r.Numr_Numb__c
```

- Syntax to retrieve quote header field as part of an expression:
 - Displaying the Quote header field from a bundle product.

```
Apttus_Config2__LineItem__c.Apttus_Config2__ConfigurationId__r.Apttus_QPCon  
nfig__ProposalId__r.Numr_Field1__c
```

- Displaying the Quote header field from an Option product.

```
Apttus_Config2__LineItem__c.  
$ParentBundle.Apttus_Config2__ConfigurationId__r.Apttus_QPConfig__Proposal  
d__r.Numr_Field1__c
```

- Syntax to retrieve product attribute value as part of an expression:

```
Apttus_Config2__ProductAttributeValue__c.Total_Daily_WattHours__c
```

Insert Field > Product Attributes > Select the field

- Syntax to define the value of an attribute using another attribute of the same product or option

```
Apttus_Config2__ProductAttributeValue__c.Length__c * .25
```

- Syntax to retrieve parent bundle product attribute value as part of an expression:

```
Apttus_Config2__LineItem__c.  
$ParentBundle.Apttus_Config2__AttributeValueId__r.Battery_Capacity_Needed__c
```

Insert Field > Line item > ParentBundle > AttributeValue > Select the field

- Syntax to define rollups on header
Specify the Object to be updated and the field of the object to be updated. In the

value expressions field, specify the fields from which you want to fetch the values from.

```
BLANKVALUE($.AttributeValue__r.Total_daily_WattHours_required__c, 0) * 3
```

- Syntax to define rollups for Products
Specify the scope as Product, and enter Product name in the Product field. Ensure that you define a parent field as LineltemId_c in the Rollup Criteria area.
- Syntax to define rollups for Options
Specify the scope as Product, and in the Match Expression area, enter
ParentBundleNumber__c == \$condition.PrimaryLineNumber__c
- Syntax to define rollups Product Group
Specify the scope as Product Group, and enter Product Group name in the Product Group field. Ensure that you define a parent field as LineltemId_c in the Rollup Criteria area.
- Syntax to define rollups for specific Quote Numbers or Account Numbers:
Specify the scope as Header, and in the Match Expression area, enter

```
BLANKVALUE(ConfigurationId__r.ProposalId__r.Apttus_Proposal__Account__r.Name ==  
'Account Name', 0)
```

- Syntax to define option rollups for specific bundles or multiple bundles
Specify the scope as Product, specify the product name in the Product field and in the Match Expression area, enter

```
ParentBundleNumber__c == $condition.PrimaryLineNumber__c
```

Ensure that you define a parent field as LineltemId_c in the Rollup Criteria area.

- Syntax to define a rollup based on the sum of attribute values
Specify the scope as Product, specify the product name in the Product field and in the Expression Criteria area, specify the Value Expression as

```
BLANKVALUE($.AttributeValue__r.PerfAttr1__c, 0) +  
BLANKVALUE($.AttributeValue__r.PerfAttr2__c, 0) +  
BLANKVALUE($.AttributeValue__r.PerfAttr3__c, 0)
```

Ensure that you define a parent field as LineltemId_c in the Rollup Criteria area.

- Syntax to define numeric roll upsummary record in a numeric expression
In order to roll up the specific product attribute (which is numeric) based on the options product quantity roll up, do the following.
In the Quantity roll up for options,

Under Match Condition, specify

```
Apttus_Config2__LineItem__c.Apttus_Config2__ParentBundleNumber__c != NULL()
```

Select SUM as roll up operation.

Under Aggregate expression, specify

```
Apttus_Config2__LineItem__c.Apttus_Config2__Quantity__c
```

Then use the roll upsummary in the expression in the following way:

```
Apttus_Config2__LineItem__c.$Rollups['fieldName',value].Apttus_Config2__TotalQuantity__c
```

- Syntax to set attribute value of a product from the attribute value of another product in the cart:

```
BLANKVALUE(VALUE(Apttus_Config2__LineItem__c.
$CartLines['Apttus_Config2__ProductId__r.Family','Laptop'
].Apttus_Config2__AttributeValue__r.Size__c),17)
BLANKVALUE(VALUE(Apttus_Config2__LineItem__c.
$CartLines['Apttus_Config2__ProductId__r.Name','Toshiba Satellite S875-
S737617.3 Inch'].Apttus_Config2__AttributeValue__r.Size__c),14)
BLANKVALUE(VALUE(Apttus_Config2__LineItem__c.
$CartLines['Apttus_Config2__ProductId__r.ProductCode','LP104'
].Apttus_Config2__AttributeValue__r.Size__c),14)
```

- Syntax to set attribute value of an option item with the attribute value of another option item inside the same bundle.

```
Apttus_Config2__LineItem__c.$ParentBundle.
$Options['Apttus_Config2__OptionId__r.Name','Option
1.1'].Apttus_Config2__AttributeValue__r.Length__c
```

- Syntax to set Option's Default/Min/Max Quantity based on attribute value of the parent bundle:

```
BLANKVALUE(VALUE(Apttus_Config2__LineItem__c.
$ParentBundle.Apttus_Config2__AttributeValue__r.Data_Transfer_Limit_Month_in_
TB__c),0)
BLANKVALUE(Apttus_Config2__LineItem__c.
$ParentBundle.Apttus_Config2__AttributeValue__r.Number_of_Users__c+5, 0)
```

- Syntax to conditionally set the value of attribute or min/max/default quantities of an option item, depending on the value of an attribute from the parent bundle.

```
IF(Apttus_Config2__LineItem__c.
$ParentBundle.Apttus_Config2__AttributeValueId__r.Edition__c=='Enterprise',
BLANKVALUE(Apttus_Config2__LineItem__c.
$ParentBundle.Apttus_Config2__AttributeValueId__r.Number_of_Users__c+5, 0),
BLANKVALUE(Apttus_Config2__LineItem__c.
$ParentBundle.Apttus_Config2__AttributeValueId__r.Number_of_Users__c+10, 0))
```

- Syntax to set the quantity of an option using quantity of another option in the same bundle.

```
BLANKVALUE(Apttus_Config2__LineItem__c.$ParentBundle.
$Options['Apttus_Config2__OptionId__r.Name','Option
1.1'].Apttus_Config2__Quantity__c * 2, 0)
```

- Syntax to set the value of an attribute value or min/max/default quantities using a numeric rollup:

```
BLANKVALUE(Apttus_Config2__LineItem__c.$Config.$Rollups['Name','Cart
Weight'].Total_Weight__c,0)
```

- Syntax to set quantity of a product to the sum of quantities of other 2 products in the cart.

```
BLANKVALUE(Apttus_Config2__LineItem__c.
$CartLines['Apttus_Config2__ProductId__r.Name','Logitech Keyboard
K120'].Apttus_Config2__Quantity__c,0) +
BLANKVALUE(Apttus_Config2__LineItem__c.
$CartLines['Apttus_Config2__ProductId__r.Name','Logitech Wireless
Keyboard'].Apttus_Config2__Quantity__c,0)
```

Managing Product Rules

You can use Product Rules to regulate the selection of the products by the Sales rep on the Catalog page. When the Catalog exceeds a simple number of products, it can be difficult for the Sales rep to find their desired product based on the specific requirements of the company. Product Rules can guide the Sales rep to follow what is best and compliant for the company.

For example, your company sells a range of products and there are certain regulations you must follow to sell the products, for example, there are products that cannot be sold together, products that cannot be sold in certain regions, or products that must be sold along with another product. You can define rules for such scenarios to help the Sales rep avoid selling a partial product or sell products they are not supposed to.

Product Rules consist of a set of conditions and actions. The rules are invoked when the conditions are satisfied and based on the definitions of the rules, actions are executed on the Catalog page. You can manage them from the [Manage Rules](#) tab in CPQ Admin.

You can configure the following types of rules:

- [Constraint Rules](#): Configuration rules used to conditionally include, exclude, recommend, replace, or validate a product or set of products based on other products or set of products added to the cart.
- [Attribute-based Configuration](#): Helps you modify the product configuration on your cart based on the selection of product attributes using Product Attribute Rules and Attribute Value Matrix.

About Manage Rules Page

The Manage Rules page in the CPQ Admin user interface holds all the details of the existing constraint rules, product attribute rules, and attribute values matrices that you created. You can see them listed in the left-hand side pane. You can search, open, update, or create different rules from the Manage Rules page. In CPQ Admin, Go to the **Products** tab and from the dropdown click **Manage Rules**. There are various functionalities available for you to manage rules.

Rule Details

You can search for a rule on the Manage Rules page using the **Search** bar. You must search using any keyword that the rule name contains. You can filter out the different types of rules listed on the page. Click different icons that represent different rules to filter them.

- Constraint Rule icon ()
- Product Attribute Rule icon()
- Attribute Value Matrix icon()

Click the rule name to view the related information in the center pane. The fields **Rule Name, Sequence, Effective Date, Bundle Context, Active** and, **Description** are displayed on the center pane. You can update the rules on this page as well.

New Rules

You can create new rules using the **New Constraint Rules, New Product Attribute Rule** and **New Attribute Value Matrix** buttons on the Manage Rules page. The below table mentions the list topics you can refer in the *CPQ on Salesforce Administrator Guide* to create different rules.

Rules	Topic
Constraint Rules	Creating Constraint Rules
Product Attribute Rules	Creating Product Attribute Rules
Attribute Value Matrix	Creating Attribute Value Matrices

 You can start following the instructions from Step 5 in the abovementioned topics to create the rules.

Managing Constraint Rules

Constraint Rules are configuration rules used to conditionally include, exclude, recommend, replace, or validate a product or set of products based on other products or set of products added to the cart. For example, when Product A is added to the cart, Product B can be automatically added based on an auto-inclusion type rule. Similarly, when Product B is added to the cart, the sales rep can be prevented from adding Product C. Constraint rules

are applied to a product during the product configuration process, either on the client-side or the server-side.

Constraint rule consists of three associated Objects:

- **Constraint Rule Object:** Header level object that links the condition with the action. There are only three significant properties in this object, the active flag, action association, and condition association. To configure a constraint rule, you must first create a constraint rule header.
- **Constraint Rule Condition:** Captures the condition that triggers the rule.
- **Constraint Rule Action:** Captures the rule action that is applied to the cart when the rule condition is satisfied.

Apttus supports five types of constraint rules. Each of the rules has support for their action intents on either server-side, client-side, or both.

Rule Type	Definition	Example	Server Side Supported Functionalities	Client-Side Supported Functionalities
Inclusion	Used to add a product to the cart.	If the Sales rep has selected a laptop, then automatically include a charger.	<ul style="list-style-type: none"> • Auto-inclusion • Prompt • Message 	<ul style="list-style-type: none"> • Auto-inclusion • Prompt • Message
Exclusion	Used to exclude or prevent the addition of a product to the cart.	If the Sales rep has selected a region where a certain model of laptop is not available, then disable that laptop model.	<ul style="list-style-type: none"> • Prompt • Hide • Disable • Message 	<ul style="list-style-type: none"> • Prompt • Hide • Disable • Message
Replacement	Used to replace and add a product to the cart.	If the Sales rep has selected a product that is deprecated or not available then replaces that product with another product that is available in the catalog.	<ul style="list-style-type: none"> • Prompt • Message 	

Rule Type	Definition	Example	Server Side Supported Functionalities	Client-Side Supported Functionalities
Recommendation	Used to prompt product suggestions to the user for addition to the cart.	If the Sales rep has selected a laptop and has not selected a mouse, then recommend the user to select a mouse.	<ul style="list-style-type: none"> • Prompt • Message 	<ul style="list-style-type: none"> • Prompt • Message
Validation	Used to prevent the user from finalizing the cart without resolving validation errors.	If the Sales rep had selected a laptop and there limit to purchase only 5 units at a time, then validate the quantity.	<ul style="list-style-type: none"> • Message 	<ul style="list-style-type: none"> • Message (Except for Product Groups)

Constraint rules are optimized with the client-side caching mechanism to improve performance and user experience. You can choose to process all constraint rules at client-side or server-side, by defining the setting **Constraint Rule Execution Mode**, in *Config System Properties*.

 The constraint rules are processed at server-side by default. However, always use Client-Side Constraint Rules in a Service CPQ flow.

Note the following limitations when enabling Client-Side Constraint Rules (CSCR).

- Replacement type constraint rules are not supported.
- Product Scope, **Option Groups**, is not supported. If such a constraint rule is defined an error is displayed on the Catalog page.
- **Match in Assets** in Match Conditions for Constraint Rule Actions is only supported for Inclusion type Client-Side Constraint Rule for Prompt, Auto-include, and Show Messages actions. For Exclusion type Client-Side Constraint Rule for Prompt, and Show Message actions.

 Apttus recommends not to enable CSCR if you want to define Product Scope as **Options Groups**.

You can also execute a constraint rule across the following bundle structures:

- From parent bundle structure to nested bundle structure

- From nested bundle structure to parent bundle structure
- Across nested bundles

You must follow the best practices while defining Constraint Rules. Refer to *CPQ on Salesforce Best Practices: Governor Limits*.

Subsequent sections explain the following topics:

Creating Constraint Rules

There are two different methods you can use to create Constraint Rules. You can create new constraint rules from the beginning or clone an existing constraint rule. Follow the steps below to create constraint rules.

To create constraint rules

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click any product for which you want to define a constraint rule.
4. Click **Rules**. The page displays different rules tab.
5. Click Constraint Rule icon () next to the title, **RULES**, to launch the constraint rules listed for the product.
6. Click **New Constraint Rule** button.
7. Fill in the required details.

Field Name	Description
Rule Name	Enter a name for the constraint rule.
Is Active	Flags whether the Attribute Value Matrix is active.
Bundle Context	Indicated whether the constraint is evaluated within a bundle.
Sequence	Enter the number in which you want to sequence the constraint rule.

Field Name	Description
Effective Date	Select the date from which the constraint rule is in effect.
Expiration Date	Select the date until which the constraint rule is valid.
Short Description	Describe the constraint rule.

8. Click **Save**.

The constraint rule is created.

Also, you can clone an existing constraint rule.

To clone a constraint rule

1. Open an existing constraint rule.
2. Click the menu icon () under the **Rule Name** column.
3. Click **Clone Rule**.
4. Enter a name for the new constraint rule.
5. Click **Save**.

The constraint rule is cloned.

 If a constraint rule is deleted or deactivated, then, if it was used in an existing quote, the changes made by the rules are reverted and the user can finalize and proceed with their quote without being blocked. Apttus CPQ does not show any error while you modify the constraint rules and re-configure the products for the existing quotes.

Creating Constraint Rule Conditions

Constraint rule conditions should be met in order to trigger a rule. There may be more than one condition for a rule. A constraint rule condition is met when the Sale rep adds a product that is part of the product scope you defined in constraint rule condition, to the cart. When the constraint rule condition is satisfied, the constraint rule action is executed on the cart. Different conditions are associated with an expression. When the condition association expression is not specified, all the conditions should be met in order to trigger the rule.

The rule condition is defined by product scope. Product scopes are groups in which the product belongs or a set of fields you can use as conditions. The product scope could be

specific to a Product, Product Family, Product Group, Product Option Group, and a Product Field Set. Product scopes are explained in detail later in this section.

You can define additional condition criteria like Country Codes or Color. The additional criteria on the condition is based on the line item object. Condition Criteria filter conditions that are applied to the line item created from the selected products that are within the product scope definition.

When criteria is defined, the condition is met when the product scope specification and criteria are both met. For example, based on your company's requirement, you cannot sell Product B if you are selling more than 3 units of Product A. In this case, you can define condition criteria to validate the quantity of Product A.

When using a constraint rule with condition criteria for a product with multiple line items, the system only validates the primary line item to evaluate the constraint rule.

You must [run a criteria maintenance](#) job whenever you add, remove, or make any changes to criteria. Even if you remove a constraint rule that has criteria defined, you must run a criteria maintenance.

 You can create a Constraint Rule Condition or Constraint Rule Action criteria that is based on a field from the Product Attribute Value Extension object.

To Create Constraint Rule Conditions

You must have an existing constraint rule header.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click any product for which you want to define a constraint rule.
4. Click **Rules**. The page displays different rules tab.
5. Click Constraint Rule icon () next to the title, **RULES**. All the constraint rules associated with that product are displayed.
6. Search and click the constraint rule.
7. Fill in the required details under the **IF(scope)...** section. Enter a number under **Condition** column.
8. Select one of the following options from **Product Scope** drop down. The last column changes based on the product scope you select. Enter the name in the last column accordingly.

Option	Description
Product	After selecting, enter the name or product code of the product in the Product field. This implies that the product should be present in the shopping cart in order to meet the condition.
Product Family	After selecting, enter a Product Family name in the Product Family field. When specified, one or more products from the specified Product Family should be present in the shopping cart in order to meet the condition. The number of products that should be present depends on the Match Rule.
Product Group	After selecting, enter a product group in the Product Group field. This implies that one or more products from the specified product group should be present in the shopping cart. The number of products that should be present depends on the Match Rule.
Product Field Set	<p>After selecting Product Field Sets in the product scope, an add icon (+) is displayed, add product fields. This implies that when the value of the field specified in the product scope matches the value of the field on the cart, the constraint rule condition is satisfied. You must add at least one Product Field.</p> <ol style="list-style-type: none"> a. Click the add icon (+). b. Select a product field from the picklist. c. Select an operator. d. Define the value of the product field in Value. Each of the Product Field has onepick list value from the product object. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> The Product Field should be set up to have only one choice. If the choices are changed at a later time, the constraint rule conditions with Product Field Set specification should also be updated to have the correct values. Match Rule is not applied on Product Field Set based constraint rules. CPQ considers Match Rule as Match Any in Group by default in such case.</p> </div>

Option	Description
Product Option Group	<p>After selecting this option, enter an Option Group ID associated with the bundle in the Product Option Group field. This implies that one or more products from the specified product option group must be present in the shopping cart. The number of products that must be present depends on the Match Rule.</p> <div style="border: 1px solid #ffc107; padding: 5px; margin-top: 10px;"> <p> If you define the constraint rule in CPQ Admin, enter the option group name associated with the bundle in the Product Option Group field.</p> </div>
Header Level	This functionality is deprecated.

- Click the setting icon (). A pop-up is displayed. Click **CONDITIONS** tab and fill in the details as explained below.

Option	Description
Condition Name	The name is populated automatically. You can edit the name as you desire.
Match In Primary Lines	Selecting this means the condition is met only when the condition products are among the primary lines (bundle or standalone) of the shopping cart.
Match In Options	Selecting this means the condition is met only when the condition products are in the option line items of the shopping cart.
Match in Cart Options	Selecting this means the condition is met only when the condition products are among the cart line items of the shopping cart.
Match in Location	Selecting this means that constraint rules are executed within a location selected on the catalog. When the Sales rep selects a location and adds the condition product to the cart, constraint rule actions are executed. Upon changing the location, constraint rules are invoked again if conditions are met for the newly selected location.

Option	Description
Match in Related Lines	Selecting this means the condition is met only when the condition products are among the related lines (bundle or standalone) of the shopping cart.
Match Rule	<p>Select one of the following choices. The value is None by default. Match count is done before applying the criteria.</p> <ul style="list-style-type: none"> • <i>None</i> means that the rule condition is met if any one of the products in the product scope is selected. It is treated as Min/Max with Match Min Products as 1. • <i>Match Any In Group</i> means that the rule condition is met if any one or more of the products from the group is selected. <i>Match Any In Group</i> is the same as Include Min/Max with Match Min Products as 1. It is also applicable to the Product Family and Product Field Set. • <i>Match All In Group</i> means that all of the products from the group must be present in the shopping cart to meet the condition. This is applicable only to the product group and Product Family. • <i>Min/Max</i> also requires you to specify a value in the Match Min Products field.
Match Min Products	This field is applicable only when you select Min/Max from the Match Rule picklist. The condition is met, when the minimum number of products specified is selected from the Product Group, Product Family, or as specified by the Product Field Set specification.
Match Max Products	This field is applicable only when you select Min/Max from the Match Rule picklist. The condition is met, when the max number of products specified is selected from the Product Group, Product Family, or as specified by the Product Field set specification.

Match Rule is applicable to product scope of type Product Group, Product Family, and Product Field Set only.

10. Click **Save**.
11. Click the flare icon () to define condition criteria. A pop-up is displayed.
12. Click **New Filter**.
13. Type a **Field**, an **Operator**, and type a **Value**. You can enter more than one criteria.
14. Click **Save**.

You can add multiple conditions in a constraint rule. Click add icon (+) and follow the steps again.

You can also define condition association to define additional criteria to further filter the product scope condition. Next to **IF(scope)...**, select *Custom* from the drop-down menu. When there are more than one condition for a constraint rule, this field defines when to consider one or more of the conditions using AND/OR association. The sequence number defined in the **Condition** column is used as an identifier of the condition.

Few examples, you defined conditions with sequence numbers as 1, 2, 3, 4, 5, and 6. The following examples describe various condition association

Condition Association	Description
(1 AND (2 OR 3))	Either Conditions 1 and 2 or Conditions 1 and 3 must be satisfied on the cart
1 AND NOT 2	Condition 1 is in the cart while Condition 2 is not
1 AND NOT(2)	Condition 1 is in the cart while Condition 2 is not
1 AND 1	Only Condition 1 is evaluated on the cart. If you have defined multiple conditions, CPQ does not evaluate the remaining conditions
NOT(5 OR 6)	Neither Condition 5 or 6 are in the cart
NOT 5 AND 6	Condition 5 is not in the cart, but Condition 6 is in the Cart.

Apttus recommends you to use logical operator - AND - to display the resultant record if all the conditions separated by AND is TRUE. For instance, (1 OR 2) AND (3 OR 4) AND 5. If you enter an invalid condition association, an error is displayed when you save the constraint rule.

 You must set the Sequence for each condition or the Condition Association will be unreliable. Also, a constraint rule with only NOT in condition will not work. Example, NOT (1 AND 2).

The constraint rule conditions are created. You can now define a constraint rule action.

Creating Constraint Rule Actions

Constraint rule actions are performed, when certain constraint rule conditions are met. A rule action can be of inclusion, exclusion, validation, recommendation, or replacement type.

- An inclusion rule action enforces selection of certain products as specified by the product scope specification or criteria specification in the inclusion rule.
- Similarly an exclusion rule action enforces exclusion of certain products from the shopping cart.
- The validation rule displays an error message when the criteria conditions are met.
- The recommendation rule displays products based on the condition. The recommendation rules support Product, Product Family, and Product Group.
- The replacement rule helps you swap a product with another product by displaying a message with products that can be replaced. This is useful when an organization decides to discontinue a product and prompts you to go for a replacement.

 CPQ supports replacement rules on ABO carts only for Swap and Split-Swap.

While creating a constraint rule action, when you select product scope as Product, you must enter details only in the Product field. Similarly, when you select product scope as Product Family or Product Group, you must enter details in their corresponding fields only.

- ✓ You should be careful not to put too many actions into a single constraint rule. You must follow the best practices while defining Constraint Rules. Refer to *CPQ on Salesforce Best Practices: Governor Limits*. You should test the constraint rules thoroughly before pushing them to a live environment.

For Validation type constraint rules, you can set up action criteria by defining product scope as Action Criteria. Action criteria validate the condition against the criteria you defined and executes the action intent. For example, based on your company's requirement, you cannot sell more than 3 units of Product A at a time. In this case, for condition as Product A, you can define action criteria to validate if the quantity of Product A is more than 3. If the quantity is more than 3, CPQ executes the action intent which could be an error or a warning.

When the criteria conditions are met, based on the action intent the rule action message is displayed either instantly or upon finalization. You can use the line item fields and related fields of the line item object, such as the attribute value field, product configuration fields, and product fields can also be used. When you use a constraint rule with action criteria for a product with multiple line items, the system only validates the primary line item to evaluate the constraint rule.

If the rule action is error type, the Sale rep cannot finalize the configuration until the criteria condition values have changed to make the validation ineffective.

You must [run a criteria maintenance](#) job whenever you add, remove or make any changes to criteria. Even if you remove a constraint rule that has criteria defined, you must run a criteria maintenance.

To create a Constraint Rule Action

You must have an existing constraint rule header with an existing rule condition. Select the constraint rule header. The Constraint Rule detail page appears.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click any product for which you want to define a constraint rule.
4. Click **Rules**. The page displays different rules tab.
5. Click Constraint Rule icon () next to the title, **RULES**. All the constraint rules associated with that product are displayed.
6. Search and click the constraint rule.
7. Fill in the required details under the **THEN(statements)...** section. Enter a number under **Action** column.
8. From **Action Type**, select one of the following:

Option	Description
Exclusion	Enforces exclusion of certain products from the shopping cart.
Inclusion	Enforces selection of certain products as specified by the product scope specification or criteria specification in the inclusion rule.
Recommendation	Product recommendations are displayed when the condition is met.
Replacement	Product replacements are suggested when the condition is met.
Validation	Displays the error message when the criteria conditions are met.

Action Type selection impacts the options available for **Action Intent**.

Constraint rules of **Action Types** = *Recommendation* and *Replacement* do not support **Condition Criteria** and work only for the Product Scope.

9. From **Action Intent**, select one of the following:

Option	Description
Check on Finalization	Applies rule action on finalization of the shopping cart.
Disable Selection	Disables selection of excluded products.
Hide	<p>Hides the selection of excluded products.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i If the value Hide is not present in the picklist, you can add the value in the picklist by following the steps below.</p> <ol style="list-style-type: none"> a. Go to Setup > Create > Objects > Constraint Rule Action > Action Intent b. Click New. Type Hide and click Save. <p>After adding the value, on the Action Intent details page find the field Controlling Field under the section Picklist Options and click [Change]. Double-click Hide below Exclusion (do not select Hide for any other Action Types). Click Save.</p> </div>
Prompt	Displays a message with choices of products that you can select or remove.
Show Message	Displays a message.
Auto Include	<p>Adds selected products automatically. When the number of products selected by the rule action is more than the number mentioned in the Match Rule condition, auto-inclusion of products is not triggered. A message is displayed from the rule action instead.</p> <p>Note: Auto Include will not apply when the match rule value is Include All.</p>

10. From **Product Scope**, select one of the following:

Option	Description
Action Criteria	The action criteria are defined using the flare icon ().

Option	Description
Product	In the Product field, click to select a product to be included or excluded. You search the product using product name or code.
Product Family	In the Product Family field, enter a Product Family. One or more of the products from the Product Family will be included or excluded based on rule type and match rule specifications.
Product Group	In the Product Group field, enter a Product Group. One or more of the products from the Product Group will be included or excluded based on rule type and match rule specifications.

11. According to the product scope you select, enter values in the last column.
12. Click the setting icon (). A pop-up is displayed. Click **STATEMENTS** tab and fill in the details as explained below.

Option	Description
Statement Name	The name is populated automatically. You can edit the name as you desire.
Match In Primary Lines	Select this option to include or exclude the products that are primary line items (offering) based on your Action Type selection.
Match In Options	Select this option to include or exclude the products that are options based on your Action Type selection.
Match in Cart Options	Select this option to include or exclude the product that are cart line items based on your Action Type selection.
Match in Asset	Select this option to exclude, auto-include, or prompt to include or exclude a product, product family, or product group when a product does not already exist as an installed product.

Option	Description
Repeat Inclusion	<p>Indicates that every time you add a condition product the action product is auto-included. For example, adding Product A to the cart auto-includes Product B then, if you add Product A to the cart again, Product B is auto-included again. By default, action product is only auto-included once.</p> <div data-bbox="667 577 1426 784" style="border: 1px solid #ccc; padding: 10px;"><p> You can select Repeat Inclusion for Client-Side Constraint Rules as well. However, only one condition statement with product scope is supported on client-side.</p></div>

Option	Description
<p>Min/Max Match Rule</p>	<p>Applies to inclusion and exclusion type rule action only, and that has product scope as Product Family, Product Group, or Action Criteria. Select any one of the following to complete the rule action:</p> <ul style="list-style-type: none"> • <i>None</i>: No product selection is allowed. <p>For inclusion type constraint rule:</p> <ul style="list-style-type: none"> • <i>Include Any</i>: Allows selection of up to one product. Rest of the products in the prompt are disabled. • <i>Include All</i>: Allows selection of all products within the Product Group or Product Family. Note: Only this match rule works with Action Intent Auto Include. • <i>Include Min/Max</i>: Requires a minimum number of products specified in the Min Products field. <p>For exclusion type constraint rule:</p> <ul style="list-style-type: none"> • <i>Exclude All</i>: All the products are excluded. • <i>Exclude After One</i>: Allows selection of only one product. Any other selection will trigger the rule action. • <i>Exclude After Max</i>: Allows selection of a maximum number of products specified in the Max Products field. Any other selection over and above the specified number will trigger the rule action. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> When you define Min/Max for options at Option Group level, then Option Group level configuration is honored over the Min/Max Match Rule for prompt type inclusion constraint rule. Hence, if the maximum value that is configured at Option Group level is satisfied then the remaining options are disabled.</p> </div>
<p>Sequence</p>	<p>Enter a number to indicate the order in which constraint rule action messages should be displayed.</p>

Option	Description
Message Type	Select from <i>Error</i> and <i>Warning</i> . If you select <i>Error</i> , you cannot finalize the cart unless you satisfy the constraint rule and if you select <i>Warning</i> , you can finalize the cart but the warning message is displayed on the cart until you satisfy the constraint rule.
Message Details	Enter text to be displayed when the rule action is effective. These messages can also be translated in multiple languages . For inclusion and exclusion type rule actions product name substitution parameter {0}, {1} can be used. For example: {0} requires {1} . For validation type rule actions only {0} will be substituted by triggering products.

13. Click **Save**.
14. Click the flare icon () to define action criteria. A pop-up is displayed.
15. Click **New Filter**.
16. Type a **Field**, an **Operator**, and type a **Value**. You can enter more than one criteria.
17. Click **Save**.

You can add multiple actions in a constraint rule. Click add icon () and follow the steps again.

Constraint rule actions are created which will trigger when a constraint rule condition is met.

Translating Custom Messages for Constraint Rules

Custom messages for Constraint Rules can be translated in multiple languages based on the User's org language.

These messages can be translated from the Custom Messages tab. To set up, you require the Message, Message Tag, and the Source Object ID. The Source Object ID is the Constraint Rule Action ID.

You can add as many language as you want that are supported by Salesforce.

To translate custom messages

You must have an existing constraint rule with message.

1. Click and click **Custom Messages**.

2. To create a new custom message, click **New**.
3. Type a mandatory **Custom Message Name**.
4. In **Message**, type the same message you defined in the constraint rule action. For example: If the Constraint Rule Action Message is *{1} should be suggested when customers select {0}*, the Custom Message must also be *{1} should be suggested when customers select {0}*.
5. Based on the language of the User's profile, type the translated message in the relevant message box. For example: For German, type the message in German language in Message_de box.
6. In **Message Tag**, type the same message as in the Message box.
7. Type or copy and paste the **Source Object Id**.
8. Click **Save**.

If the language of the user's profile is German, on the Catalog page, when the Constraint Rule is triggered, the message is displayed in German language.

Running the Constraint Rule Maintenance Job

Constraint Rule maintenance is a batch job that must be run whenever changes are made to rule conditions and when you upgrade to a new version of CPQ.

This includes:

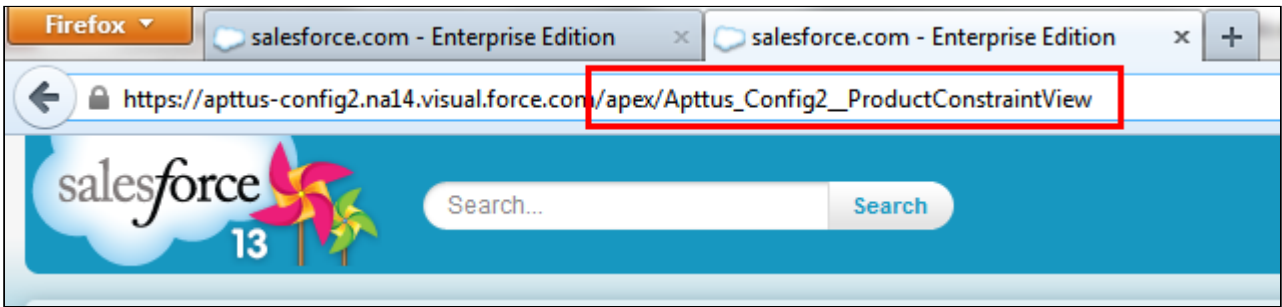

- Adding or removing a constraint rule.
- Adding or removing a constraint rule condition.
- Modifying anything in a constraint rule condition.

Users who are going to run Constraint Rule Maintenance must have read/write access to ProductConstraintView__c object . All CPQ users must have at least read access. These users should also have ProductConstraintView Visualforce page access and Apex class access enabled.

If the Constraint Rule Maintenance tab is not already available, you can add it as follows:

1. Go to **App Setup > Create > Apps** and click **Edit** beside **Apps Apttus Batch Updates**.
2. Add **Constraint Rule Maintenance** and click **Save**. The tab should now be available.

If the tab is still not available, as a workaround you can manually append apex/Apttus_Config2__ProductConstraint View to your URL in the address bar.

To run a constraint rule maintenance job

1. Go to the Constraint Rule Maintenance tab.
2. Click **Update All**.

Update Product Constraints View

Use the Update All command to update all constraint rules.

Batch Jobs

Job Name	Created By	Created Date	Status	Status Detail	Completion Date	Total Batches	Batches Processed	Failures
ProductConstraintViewUpdateJob	Vinod Nair	6/20/2013 11:59 PM	Completed	100%	6/21/2013 12:02 AM	234	234	0
ProductConstraintViewUpdateJob	Vinod Nair	6/20/2013 11:59 PM	Completed	0%	6/20/2013 11:59 PM	0	0	0
ProductConstraintViewUpdateJob	Dipankar Das	6/20/2013 10:37 PM	Completed	100%	6/20/2013 10:41 PM	234	234	0
ProductConstraintViewUpdateJob	Dipankar Das	6/20/2013 10:37 PM	Completed	0%	6/20/2013 10:37 PM	0	0	0
ProductConstraintViewUpdateJob	Dipankar Das	6/20/2013 6:24 AM	Completed	100%	6/20/2013 6:26 AM	234	234	0

The batch job is executed. The administration task is complete and an updated history for all the batch jobs is displayed. The key item to observe is Status. When Completed is displayed it means the job has run successfully, even if the percentage indicator remains at 0%.

i When you run the Constraint Rule Maintenance job, Apttus CPQ inserts new rule records without affecting existing records and the quotes with existing records.

Providing Scalability in Constraint Rules

Despite you have configured large number of constraint rules for your products, Apttus CPQ executes the Constraint Rule Maintenance Job seamlessly.

You can set upto 10000 constraint rules and 100 conditions for a single constraint rule in order to meet your business requirements, which in turn gives you flexibility to upscale your product configuration.

Configuring Inclusion Rules

Inclusion rule use case: You have a product A and product B. You want to set up an inclusion rule such that when a user selects Product A, a warning message is displayed to include Product B.

To set up an inclusion rule

1. On the Constraint Rule Condition Detail page, in the **Criteria** section, from **Product Scope**, select *Product*.
2. In **Product**, enter *Product A* as the product and in the **Match Conditions** section, select *Match in Primary Lines* and click **Save**.
3. On the Constraint Rule Action Detail page, in **Message**, type *{0} requires {1}*. {0} denotes the condition product and {1} denotes the action product.
4. From **Action Type**, select *Inclusion* and from **Action Intent**, select *Show Message*.
5. From **Action Disposition**, select *Warning*.
6. From **Product Scope**, select *Product* and in **Product**, enter *Product B* as the product.
7. In the **Match Conditions** section, select *Match in Primary Lines* and click **Save**.

The inclusion type rule is saved and added. On the catalog page, when a user selects Product A, the system shows a warning message.

 Apttus CPQ provides support for maximum products to be added to cart using Inclusion Prompt Rule. Hence, you need to set minimum and maximum both values in order to add products and Apttus CPQ disables all remaining option products that go beyond the maximum number post selection. If you select less than the maximum value, you have to manually close the prompt as the prompt closes automatically only when the maximum number is reached.

To enable checkboxes in the prompt, select **Show Checkbox In Rule Dialog** in [Configuring Configuration Engine Settings](#).

Auto-Inclusion with Line Item Updates

While creating auto-inclusion constraint rules, you can specify an Action Criteria based on which products are auto-included. For every new product auto-included, line items are added to the cart. You can now update the fields of the auto-included line items, such as,

quantity, term, base price, and adjustment type. You can also update the fields based on condition defined in the Update Expression field.

Note

Line updates are only applicable on Auto-inclusion rules with the scope as product. Add only 10 line item expressions. Please consult with Apttus before adding more than 10 action expressions. There may be a more optimal way of approaching the requirement.

Scenario 1

If you purchase ten chargers or more, you can offer 2 USBs free. In this case, if the quantity of chargers in the cart is updated to ≥ 10 , then auto-include USB to the cart with the quantity set to 2, adjustment type set to % discount, and Adjustment value set to 100.

If the quantity of the chargers on the criteria line item is updated to less than 10 then auto remove Auto included USB line item from the cart.

Scenario 2

If you purchase a product with selling term greater than 2 years, you can auto-include 1 year of Premium Maintenance for free. In this case, if the Term of the product line item in the cart is updated to ≥ 24 , then auto include another line item in the cart for Premium Maintenance with term set to 12 months, start date set to start date of the criteria line item, adjustment type set to % discount, and Adjustment value set to 100.

If the term of the product on the criteria line item is updated to less than 24 then auto remove Auto included Premium maintenance line item from the cart for each Quantity.

Scenario 3

For every 10 chargers you buy, auto-include 2 chargers. In this case, if the quantity of chargers in the cart is updated to 56, then auto include another line item in the cart for chargers with quantity set to 10 ($56/10 = 5$), adjustment type set to % discount, and Adjustment value set to 100.

If the quantity of the chargers on the criteria line item is updated to 60 then the quantity of the Auto included charger line item in the cart is updated to 6 from 5.

If the quantity of the chargers on the criteria line item is updated to 45 then update quantity of Auto included charger line item in the cart to 4 from 5.

If the quantity of the chargers on the criteria line item is updated from 56 to less than 10 then auto remove Auto included charger line item from the cart.

To specify line item updates to Auto-Included Products

1. Navigate to **CPQ Console**, click **Inclusion Rule**. All the Inclusion Rules are listed.
2. Click **Edit Action Expression** next the **Message** field. The Edit Action Expressions popup appears.
3. Select the field you want to update and click the **Expression** field. The expression builder appears.
4. Specify the Expression using which the Line Item Field is populated. For example, you can populate the Adjusted Price as 100 percent for an Auto-included Line Item. You can also update the Line Item field based on rollup field you have defined. Specify the roll up field name.

Adding a product that triggers an auto-inclusion rule, adds another product as a line item whose fields can be populated using the Expression Builder.

Added By and Added By Rule Info

The fields **Added By** and **Added By Rule Info** on the Line Item detail page of a product holds the information about how the product was added to the cart. The **Added By** field holds the value *Constraint Rule* when the product was added through a constraint rule or *User* when the product was added by a Sales Rep. The field **Added By Rule Info** is only populated when the product is added by auto-inclusion or prompt inclusion constraint rule. The information about the constraint rule is displayed in **Added By Rule Info** field.

Configuring Exclusion Rules

Exclusion rule use case: You have a product A and product B. You want to set up an exclusion rule such that when a user selects Product A, an error message is displayed to exclude Product B.

To set up an exclusion rule

1. On the Constraint Rule Condition Detail page, in the **Criteria** section, from **Product Scope**, select *Product*.
2. In **Product**, enter *Product A* as the product and in the **Match Conditions** section, select *Match in Primary Lines* and click **Save**.
3. On the Constraint Rule Action Detail page, in **Message**, type *{1} is excluded on the addition of {0}*. {0} denotes the condition product and {1} denotes the action product.
4. From **Action Type**, select *Exclusion* and from **Action Intent**, select *Prompt*.
5. From **Action Disposition**, select *Error*.

6. From **Product Scope**, select *Product* and in *Product*, enter *Product B* as the product.
7. In the **Match Conditions** section, select *Match in Primary Lines* and click **Save**.

The exclusion type rule is saved and added. On the catalog page, when a user selects Product A, and then selects B. The system shows an error message that Product B is excluded in the addition of Product A.

Hide excluded options at rule or product level

You can hide the disabled options at an individual product level in addition to the global level wherein it is applied on all products.

You can hide the product options that are excluded by using the Exclusion type constraint rule.

Suppose you have a product, Bundled ABC Software and Hardware with the following options:

1. 24x7 Same Day Onsite Response
2. 24x7 Support for Sev 1
3. Proactive Support Services
4. Remote Account Manager

Then you can select option 1 and disable options 2 to 4. You have the flexibility to hide disabled options at product level. This enables you to use the product configuration for the targeted product.

Configuring Validation Rules

Validation rule use case: You have a product A and you want to set up a validation rule such that when a user selects Product A and should not be able to enter more than 5 quantity.

To set up a validation rule

1. On the Constraint Rule Condition Detail page, in the **Criteria** section, from **Product Scope**, select *Product*.
2. In **Product**, enter *Product A* as the product and in the **Match Conditions** section, select *Match in Primary Lines* and click **Save**.
3. On the Constraint Rule Action Detail page, in **Message**, type *{0} cannot exceed 5 quantity*. {0} denotes the condition product.
4. From **Action Type**, select *Validation* and from **Action Intent**, select *Show Message*.
5. From **Action Disposition**, select *Warning*.
6. From **Product Scope**, select *Action Criteria*.

7. In the **Match Conditions** section, select *Match in Primary Lines* and click **Save**.
8. On the Constraint Rule Detail page, scroll down to the Constraint Rule Actions related list and click **Edit Criteria**.
9. From **Field**, select *Line Item : Quantity*, from **Operator**, select *greater than*, and in **Value**, type 5. Click **OK**.

The validation type rule is saved and added. On the catalog page, when a user selects Product A, and enters quantity as 6. The system shows an error message that Product A cannot exceed 5 quantity.

Configuring Product Option Group in Product Scope

A constraint rule supports the product option group as a scope.

While creating the constraint rule condition, you can add a Product Option Group picklist value under Product Scope and have a lookup field for the Product Option Group, which is represented by a product ID. These product IDs are different for each bundle and help trigger a constraint rule separately for each bundle. Earlier instead of product IDs, different option groups were created and shared across bundles, which in turn caused malfunctioning of the constraint rules.

Use Case: 24x7 support option must be included when all options are selected from the Additional Services option group (Option Group (Match All) to Product, Auto-include rule) Suppose you are configuring the Apttus Snap Performance bundle, when you select the Telephone Support option, Email Support option, and Online Chat Support option, then you can see that the 24x7 Support option is selected by the system automatically.

Similarly, When you select all of the service options from the Additional Services Option Group. you can automatically include a support option for the following constraint rule criteria:

- Option to Option, Option Group (Match All) to Product, Auto-include
- Option to Option, Option Group (Match All) to Product, Recommendation
- Option to Option, Option Group (Match All) to Product, Validation
- Option to Option, Option Group (Match All) to Product, Replacement
- Option to Option, Option Group (Match Any) to Product, Auto-included

Additionally, when you select all of the service options from the Additional Services Option Group. you can automatically exclude a support option for the following constraint rule criteria:

- Option to Option, Option Group (Match All) to Product, Disable Selection
- Option to Option, Option Group (Match Any) to Product, Disable Selection
- Option to Option, Option Group (Match Any) to Product, Recommendation
- Option to Option, Option Group (Match Any) to Product, Replacement
- Option to Option, Option Group (Match Any) to Product, Validation

i On the Server side, Apttus CPQ supports the Product Option Group as a scope for constraint and attribute rules, wherein the option groups are shared amongst the bundle products through associations.

Scenarios for Using Constraint Rules

- [State-based Constraint Rules](#)
- [Constraint Rules with Prompt Scenarios](#)
- [Criteria-based Replacement Rules on the Server-side](#)

State-based Constraint Rules

A constraint rules evaluates a state of the configuration while presenting options. For example, an inclusion rule may have an action to add option A or B to the model, but option A has already been excluded by a different rule that was associated with a different selection Hence, in this case option A is not available for selection.

Use Case:

Bundle 1 - Laptop

Processor 1TB (Option 1)

Processor 2TB (Option 2)

Bundle 2 - CISCO Switch

8 Ports (Option 1)

12 Ports (Option 2)

16 Ports (Option 3)

Cisco Server (standalone)

Office 365 (standalone) Product Group Software

Google suite(standalone) Product Group Software

Rule setup -

Rule 1 - Condition add Cisco Server. Google Suite is excluded. Setup exclusion error rule

Rule 2 - Condition add Cisco Switch, Office 365 is excluded. Setup exclusion warning rule

Rule 3 - Condition add laptop, Product Group Software is included (max 1). Setup inclusion error rule.

Scenario 1 (error) = Rule 1 and 3 are explained below:

- You add Cisco Server to cart, Google Suite is disabled and Apttus CPQ displays an error message.
- You configure a laptop, you are prompted to add a product from Product Group Software, Google Suite is disabled on prompt, and Office 365 is available to be added.

Scenario 2 (Warning) = Rule 2 is explained below:

You add Office 365 to cart, then add Cisco Switch to cart, Apttus CPQ removes Office 365 and provides a warning message.

Constraint Rules with Prompt Scenarios

On the inclusion prompt, CPQ disables or hides the products that are excluded by an exclusion type constraint rule to keep the validity of the cart intact.

When a product is disabled, CPQ shows an error message on the Cart or Catalog page.

However, for the Warning type exclusion rule the product is not disabled in the prompt.

When you enable **Hide Disabled Options** setting under Config System Properties, then CPQ hides the product.

Use Case:

Bundle 1 - Laptop

Processor 1TB (Option 1)

Processor 2TB (Option 2)

Bundle 2 - CISCO Switch

8 Ports (Option 1)

12 Ports (Option 2)

16 Ports (Option 3)

Cisco Server (standalone)

Office 365 (standalone) Product Group Software

Google suite(standalone) Product Group Software

Rule setup

Rule 1 - Condition add Cisco Server. Google Suite is excluded. Setup exclusion error rule

Rule 2 - Condition add Cisco Switch, Office 365 is excluded. Setup exclusion warning rule

Rule 3 - Condition add laptop, Product Group Software is included (max 1). Setup inclusion error rule.

Scenario 1 (error)

Jane adds Cisco Server to cart

Google Suite is disabled

System displays Error Message

Jane configures laptop

User is prompted to add product from Product group software

Google Suite is disabled on prompt

Office 365 is available to be added

Scenario 1 (Warning)

Jane adds Office 365 to cart

Jane adds Cisco Switch to cart

System removes Office 365 and provides Warning Message

Jane configures laptop

User is prompted to add product from Product group software

Google Suite and Office 365 is available to be added

Criteria-based Replacement Rules on the Server-side

Replacement rules on Server-side that based on the condition criteria that must be defined using fields from the following objects:

- Line Item
- Product
- Configuration
- Option
- Product Attribute Value

The condition criteria comprise a filter expression with operators and values.

 Replacement type constraint rules are not supported on the Client-side.

Use Case for Replacement type constraint rule:

You bought 5 units of Performance Cloud -Enterprise, CPQ prompts to replace the product with Performance Cloud- Ultimate.

Rule has following constraint rule Action and Condition

Condition:

Product scope: Product

Product: Performance Cloud -Enterprise

Condition criteria: Quantity = 5

Action:

Action type: Replacement

Action Intent: Prompt

Product Scope: Product

Product: Premium Support

Managing Attribute-Based Configuration

Attribute-Based Configuration helps you customize the product configuration on your cart on the basis of selection of product attributes. The attributes define characteristics or the desired features for the product. The attribute configuration may or may not affect price of the product. Each attribute value selection ensures that the rest of the attributes get filtered on the basis of selected attributes and the result set is narrowed. The attributes can also leverage expressions and calculations to derive values that help identify the products.

Note

- Ensure that you have selected **Has Attributes** check box in your product.
- Ensure that you have selected **Enable Field Expression** in the *Config System Properties* in [Configuring Custom Settings](#).

With the New UI, Apttus CPQ allows you to create and configure an unlimited number of attributes, overcoming the 800 record limit of Salesforce. You can use additional attributes for Product Definitions, Product Configurations, and Attribute-based Rules.

For an example, suppose you have a product configuration behavior similar to a laptop review website where the selection of RAM and HDD restricts the Color and Screen Size, and selection of Color and Screen Size restricts any other component. The dependencies can be in any direction without having a set selection sequence. Within Apttus, you have to create a Compatibility table to define all the valid combinations for the Color, Screen Size, RAM, HDD, and Fingerprint Reader picklist values.

The attribute-based configuration provides a rules framework to drive configuration based on your Product Attributes. The rules framework allows you to set up the following dependencies or rules between the product attributes. You should perform the following steps depending on your business requirements.

1. Create Products
2. Create Product Attributes
3. Create a Product Attribute Group
4. Associate Product Attribute Group to a Product
5. Create Product Attribute Values
6. Create Attributes in Attribute Value Matrix Entry object
7. Create Attribute Value Matrices
8. Create Product Attribute Rules

Creating Product Attribute Values

You must create the attributes that you want to add in your product as custom fields in the Product Attribute Value object. You must add these attributes in the Attribute Value Matrix Entry object as well, in case you want to use Attribute Value Matrix.

In our example, we have added Laptop Color, Laptop RAM, Laptop Screen Size, Laptop Fingerprint Reader, and Laptop HDD attributes to the Product Attribute Value object.

Edit Del Replace	Laptop Color	Laptop_Color__c	Picklist	10/5/2015 10:56 PM	<input type="checkbox"/>
Edit Del Replace	Laptop Fingerprint Reader	Laptop_Fingerprint_Reader__c	Picklist	10/5/2015 11:00 PM	<input type="checkbox"/>
Edit Del Replace	Laptop HDD	Laptop_HDD__c	Picklist	10/5/2015 10:58 PM	<input type="checkbox"/>
Edit Del Replace	Laptop RAM	Laptop_RAM__c	Picklist	10/5/2015 10:58 PM	<input type="checkbox"/>
Edit Del Replace	Laptop Screen Size	Laptop_Screen_Size__c	Picklist	10/5/2015 10:59 PM	<input type="checkbox"/>

To create product attribute value

1. Go to **Setup > App Setup > Create > Objects** and select **Product Attribute Value**.

 If you have more than 800 attributes already create Product Attribute Value object, use Product Attribute Value Extension objects. For more details, refer to [Creating Product Attribute Value Extensions](#).

2. Under Custom Fields & Relationships section, click **New**.
3. Select **Picklist** from the Field Type.
4. Click **Next**.
5. Enter **Field Label**.
6. Enter values for picklist.
7. Click **Next**.
8. Establish field level security and click **Next**.
9. Select appropriate page layouts where you want to add this field.
10. Click **Save**.

Let's create Laptop RAM attribute in the Product Attribute Value object.

1. Go to **Setup > App Setup > Create > Objects** and select **Product Attribute Value**.
2. Under Custom Fields & Relationships section, click **New**.
3. Select **Picklist** from the Field Type.
4. Click **Next**.
5. Enter Laptop RAM as **Field Label**.
6. Enter 4, 8, 16 (separated by a line) as values for picklist.
7. Click **Next**.
8. Establish field level security and click **Next**.
9. Select appropriate page layouts where you want to add this field.
10. Click **Save**.

Similarly, create Laptop Color, Laptop HDD, Laptop Screen Size, and Laptop Fingerprint Reader attributes in the Product Attribute Value object.

You have created attributes in the Product Attribute Value object.

Creating Product Attribute Value Extensions

Apttus CPQ has been enhanced to create and configure an unlimited number of attributes, overcoming the 800 record limit of Salesforce. You can create custom Product Attribute Value extension objects that are a replica of the Product Attribute Value object. All of these attributes created under the extension object can be used as normal attributes for your products. These objects are an extension to the Product Attribute Value object through a combination of master-detail and look-up relationships.

The fields from the extension objects are displayed in the Product Console to be associated as attributes with the products.

- This enhancement is available in the CPQ Admin UI only.
- The attributes added in the Product Attribute Value Extension object are not available for Price Dimensions (Pricing engine). Only the first 800 attributes will be visible for the pricing.

Follow the steps below.

To create a custom extension object

1. Navigate to **Setup > App Setup > Create > Objects** and click **New Custom Object** to create a new extension object.
2. Enter the desired label, such as *Product Attribute Value Ext 1* to indicate that this object is an extension to Product Attribute Value object.
3. Fill in the requisite details and click **Save**.
4. Navigate to the Custom Fields & Relationships section and click **New** to create a new custom relationship.
5. Choose *Master-Detail Relationship* as the **Field Type** and click **Next**.
6. From the **Related To** drop-down list, choose *Product Attribute Value* and click **Next**.
7. In the **Field Label**, type *ProductAttributeValueeld* and click **Next**.
8. Choose necessary **Field level security** for the reference field and click **Next**.
9. Choose the page layouts where you want to reference this field and click **Next**.
10. Verify the **Related List Label** for your field and click **Save**.

Ensure that the API name for the newly created custom relationship is *ProductAttributeValueeld__c*, as shown in the figure below.

The screenshot shows the 'Custom Object Definition Detail' for 'Product Attribute Value Ext 1'. The API Name is 'Product_Attribute_Value_Ext_1__c'. Below this, the 'Standard Fields' table lists 'CreatedBy' and 'LastModifiedBy' as Lookup(User) fields, and 'Product Attribute Value Ext 1 Name' as a Text(80) field. The 'Custom Fields & Relationships' table shows several fields, including 'ProductAttributeValueeld' which is a Master-Detail relationship with the API Name 'ProductAttributeValueeld__c' and is indexed.

Action	Field Label	Field Name	Data Type	Controlling Field
	Created By	CreatedBy	Lookup(User)	
	Last Modified By	LastModifiedBy	Lookup(User)	
Edit	Product Attribute Value Ext 1 Name	Name	Text(80)	✓

Action	Field Label	API Name	Data Type	Indexed	Controlling Field	Modified By
Edit Del Replace	KK_Ext1Multiselect	KK_Ext1Multiselect__c	Picklist (Multi-Select)			Hardik Ghia, 2/22/2016 11:32 PM
Edit Del	KK_Ext1Numb1	KK_Ext1Numb1__c	Number(14, 4)			Hardik Ghia, 2/22/2016 11:34 PM
Edit Del Replace	KK_Ext1Picklist1	KK_Ext1Picklist1__c	Picklist			Hardik Ghia, 2/22/2016 11:17 PM
Edit Del	KK_Ext1Text1	KK_Ext1Text1__c	Text(255)			Hardik Ghia, 2/22/2016 11:33 PM
Edit Del	ProductAttributeValueeld	ProductAttributeValueeld__c	Master-Detail(Product Attribute Value)	✓		Hardik Ghia, 2/22/2016 11:05 PM

After you have created the extension object, follow the same steps mentioned [here](#) to create the attributes for this object in the form of custom fields.

To create a lookup relationship with the Product Attribute Value extension object

For each extension object, a lookup relationship must be created so that the objects are connected.

1. Navigate to **Setup > App Setup > Create > Objects** and search for *Product Attribute Value* object.
2. Under the Custom Fields & Relationships section and click **New** to create a new custom relationship.
3. Choose *Lookup Relationship* as the **Field Type** and click **Next**.
4. From the **Related To** drop-down list, choose the object you created in the above procedure. In our example, choose *Product Attribute Value Ext 1* and click **Next**.
5. In the **Field Label**, type *ProductAttributeValued1*. In the **Field Name**, type *ProductAttributeValued1* and click **Next**.
6. Choose necessary **Field level security** for the reference field and click **Next**.
7. Choose the page layouts where you want to reference this field and click **Next**.
8. Verify the **Related List** label for your field and click **Save**.

Ensure that the API name for the newly created custom relationship is *ProductAttributeValued1__c*.

Field Information			
Field Label	ProductAttributeValued1	Object Name	Product Attribute Value
Field Name	ProductAttributeValued1	Data Type	Lookup
API Name	ProductAttributeValued1__c		
Description			
Help Text			
Created By	Hardik Ghia , 2/22/2016 11:11 PM	Modified By	Hardik Ghia , 2/22/2016 11:11 PM
Lookup Options			
Related To	Product Attribute Value Ext 1	Child Relationship Name	Product_Attribute_Values
Related List Label	Product Attribute Values		
Required	<input type="checkbox"/>		
What to do if the lookup record is deleted?	Clear the value of this field.		

To configure Custom Settings for the custom extension object

For each lookup relationship, you create with the custom extension object, you must make an entry in a custom setting.

1. Navigate to **Setup > App Setup > Develop > Custom Settings** and click **Manage** next to **Config System Properties**.
2. Next to **System Properties**, click **Edit**.

- In the **Product Attribute Extension Tables** field, type the API name of the lookup field you have created in the above procedure. In our example, type *ProductAttributeValueId__c*.
Ensure that you have specified the API names of all your lookup relationships here, separated by a comma. For example, if you have 4 extension objects and have their corresponding 4 lookup relationships, you must specify 4 API names in this field.
- Click **Save**.

You can create attributes in Product Attributes Value Extension object the same way you create attributes in the Product Attribute Value object, just select extension object that you created in the above-mentioned steps. Refer to [Creating Product Attribute Values](#).

Creating Attributes in the Attribute Value Matrix Entry Object

The Attribute Value Matrix Entry object must comprise attributes that are the same as the entries in Product Attribute Value with the same API Name. The attributes that you add in the Attribute Value Matrix Entry object are displayed on the Attributes page on the cart.

In our example, we have added Laptop Color, Laptop RAM, Laptop Screen Size, Laptop Fingerprint Reader, and Laptop HDD attributes to the Product Attribute Value object. Hence, we must add these attributes in the Attribute Value Matrix Entry object as well.

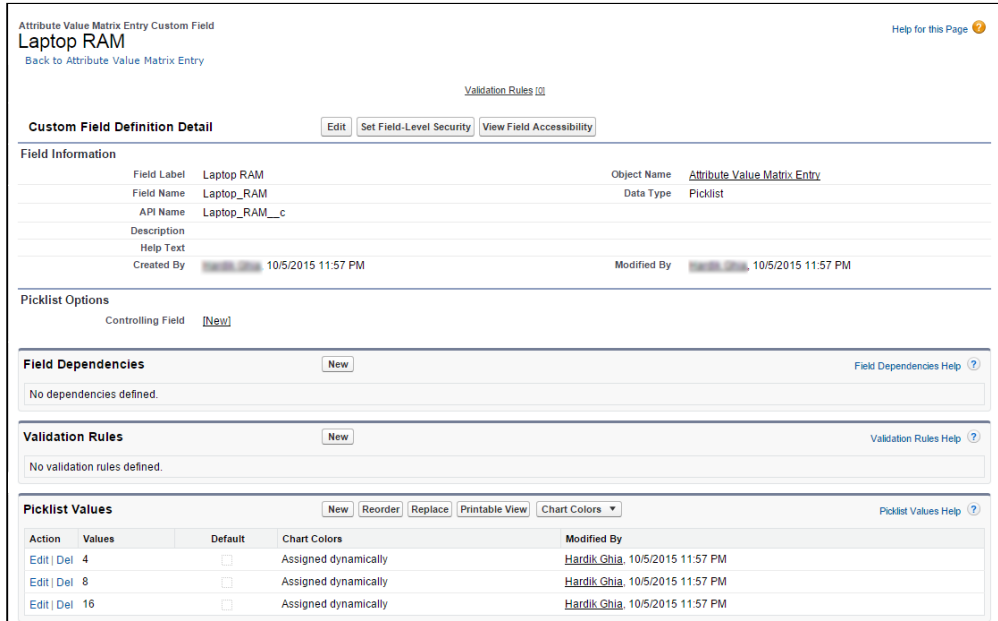

Action	Field Label	API Name	Installed Package	Data Type	Indexed	Controlling Field
Edit	Attribute Value Matrix	Aptus_Config2__AttributeValueMatrixId__c	Aptus Configuration & Pricing	Master-Detail(Attribute Value Matrix)	✓	
Edit Del Replace	BColor	BColor__c		Picklist

To create an attribute in the Attribute Value Matrix Entry object

1. Go to **Setup > App Setup > Create > Objects** and select **Attribute Value Matrix Entry**.
2. Under Custom Fields & Relationships section, click **New**.
3. Select **Picklist** from the Field Type.
4. Click **Next**.
5. Enter **Field Label**.
6. Enter values for picklist.
7. Click **Next**.
8. Establish field level security and click **Next**.
9. Select appropriate page layouts where you want to add this field.
10. Click **Save**.

Let's create Laptop RAM attribute in attribute value matrix entry object.

1. Go to **Setup > App Setup > Create > Objects** and select **Attribute Value Matrix Entry**.
2. Under Custom Fields & Relationships section, click **New**.
3. Select **Picklist** from the Field Type.
4. Click **Next**.
5. Enter Laptop RAM as **Field Label**.
6. Enter 4, 8, 16 (separated by a line) as values for picklist.
7. Click **Next**.
8. Establish field level security and click **Next**.
9. Select appropriate page layouts where you want to add this field.
10. Click **Save**.

Similarly, create Laptop Color, Laptop HDD, Laptop Screen Size, and Laptop Fingerprint Reader attributes in the Attribute Value Matrix Entry object.

You created attributes in the Attribute Value Matrix Entry object.

Now, you should create the [Attribute Value Matrix](#).

Creating Attribute Value Matrices

Attribute Value Matrices are used to associate attributes to the product. You can use the attribute value matrices to drive the product selection. You can associate a maximum of five attributes with each other. The attributes defined in the Attribute Value Matrices are bi-directional. Once you create a matrix, a compatibility table is created. This compatibility table for Attribute Values helps you define all the valid combinations for the attribute values.

Use Case

For example, Amttus, a leading laptop manufacturer, wants to use attributes to drive the product selection of their users. A laptop has five attributes: Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

After you create an attribute value matrix, when the user selects Black from the Color picklist menu, the HDD picklist menu will contain only 1 TB and 2 TB as options. RAM picklist menu will contain 8 and 16 as options. Screen Size will contain 14 and 14 HD as options. The Fingerprint Reader picklist menu will contain Yes and No as options.

To Create an Attribute Value Matrix

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click any product, preferably the one you want to associate Attribute Value Matrix with.
4. Click **Rules**. The page displays different rules tab.
5. Click Attribute Value Matrix icon() next to the title, **RULES**. Attribute Value Matrix tab is displayed
6. Click the menu icon() next to **New Constraint Rule** and click **New Attribute Value Matrix**.
7. Fill in the required details.

Field Name	Description
Matrix Name	Enter name of the Attribute Value Matrix.
Active	Flags whether the Attribute Value Matrix is active.
Effective Date	Select the date from which the Attribute Value Matrix is in effect.
Expiration Date	Select the date until which the attribute value matrix is valid.
Description	Describe the attribute value matrix.

Field Name	Description
Application Type	<p>A picklist field, which contains <i>Default</i>, <i>Constraint</i> and <i>Force Set</i> values.</p> <p><i>Default</i>: Selecting this lets you choose the picklist values which you have configured as default values in the Matrix View. The rest of the values are visible in the drop-down list, but you cannot select any of them on the Cart.</p> <p><i>Constraint</i>: Selecting this value lets you choose only those picklist values which you have configured in the Matrix View. All the other values are disabled in the drop-down list on the cart. This also works with the Multi-select picklist.</p> <p><i>Force Set</i>: Selecting this value lets you automatically set the picklist values which you have configured in the Matrix View (considering the last user selection). As soon as you change the attribute value for one attribute, the system sets the attribute values for other attributes immediately. If there is a Matrix entry with null values and Treat Null As Wildcard is set to false, the system resets the attribute values to null.</p>
Treat Null As Wildcard	<p>This field works in conjunction with Application Type. If you select this check box, all the picklist values (default or constrained) configured in the Matrix View are available for selection on the Cart. Deselecting this check box disables all the picklist values on the Cart.</p>
Matrix Fields	<p>Click the plus icon to add attributes to the attribute value matrix. If you don't select any attribute then, THEN(statements)... section remains blank.</p>

8. Select the attribute value matrix you just created from the **RULES** section.
9. Fill in the required details under the **IF(scope)...** section.

Field Name	Description
Product Family	<p>A multi-select field. Click in the text box to view the available product families and select the appropriate ones. You can also enter a keyword and search for a Product Family.</p>

Field Name	Description
Product Group	A multi-select field. Click in the text box to view the available product groups and select the appropriate ones. You can also enter a keyword and search for a product group. The product groups are filtered on the basis of product families that you select.
Products	A multi-select field. Click in the text box to view the available products and select the appropriate ones. You can also enter a keyword and search for a product. The products are filtered on the basis of product families and product groups that you select.
Account Location	A multi-select field. Click in the text box to view the available account locations and select the appropriate ones. You can also enter a keyword and search for a location. The locations are filtered on the basis of product families, product groups, and products that you select.

10. Define the desired matrix under the **THEN(statements)...** section. Click **Add Row** to add more rows to the matrix. Click **Add Column** to add more attribute in the matrix. You can add or remove the row using the action menu icon().
11. Create multiple valid combinations from the picklist menus. You can select the appropriate attributes from the picklist menu.
Note that these attribute picklists work in a bi-directional manner. For example, if you choose **LaptopColor** = *Black*, **LaptopHDD** defaults to *1TB*. Similarly, if you select **Laptop HDD** as *1TB*, the system defaults **Laptop Color** to *Black*.
12. Click **Save**.

If you create or edit the criteria, you must run **Criteria Maintenance > Update Expression Fields**.

Creating Product Attribute Rules

Product Attribute Rules allow product configuration according to product attributes that are based on the actions you select. Each attribute value selection should ensure that the rest of the attributes get constrained to allow only valid selections to help narrow the result set. The attributes can also leverage expressions and calculations to derive values that help identify the product variant. This feature simplifies the configuration process, eliminates the need for component-level choices and provides guided selling at the product configuration level. You can also set multiple actions for the same product attribute rule.

The product attribute rule is applied to the criteria that you define in the Criteria section. You can define simple and advanced criteria. In simple criteria, you can select field, operator and value. In advanced criteria, you can set a condition, if it is true, then the actions in the Action section are triggered.

If you have set a default value for a field from Salesforce and you define a product attribute rule with an action of setting the default value, then the value mentioned in the Salesforce field is set. In short, you cannot override the default value that is set in the Salesforce field by using a product attribute rule.

Note

Attributes are constrained on the basis of selection of other attributes. The constrained values are not displayed in the drop-down menu. In order to reset the list, click or select -None- from the picklist.

For example, Amttus, a leading laptop manufacturer, wants to drive the product selection of their users by using attributes. A laptop has five attributes - Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

Now, we want to set the default value of Fingerprint Reader as yes, if the user selects White from Color picklist menu and 500 MB from HDD picklist menu.

To Create a Product Attribute Rule

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Products** menu, click **Manage Products**.
3. Search and click any product, preferably the one you want to associate Product Attribute Rule with.
4. Click **Rules**. The page displays different rules tab.

5. Click Product Attribute Rule icon() next to the title, **RULES**. Product Attribute Rule tab is displayed
6. Click the menu icon() next to **New Constraint Rule** and click **New Product Attribute Rule**.
7. Fill in the required details.

Field Name	Description
Rule Name	Enter the Name of Product Attribute Rule.
Active	Flags whether the product attribute rule is active.
Effective Date	Select the date when the product attribute rule is in effect. Leave this field blank if you want this product attribute rule to be always effective.
Expiration Date	Select the date when the product attribute rule will become invalid. Leave this field blank if you want this product attribute rule to be always effective.

8. Select the product attribute rule you just created from the **RULES** section.
9. Fill in the required details under the **IF(scope)...** section. You can leave them blank if the fields are not required.

Field Name	Description
Product Family	A multi-select field. Click in the text box to view the available product families and select the appropriate ones. You can also enter a keyword and search for a product family.
Product Group	A multi-select field. Click in the text box to view the available product groups and select the appropriate ones. You can also enter a keyword and search for a product group. The product groups are filtered on the basis of product families that you select.
Products	A multi-select field. Click in the text box to view the available products and select the appropriate ones. You can also enter a keyword and search for a product. The products are filtered on the basis of product families and product groups that you select.
Criteria	Enter the formula to be evaluated. When this formula evaluates to true, the rule is executed.

 The Scope value for **Product**, **Product Family**, and **Product Group** can be left blank instead of the default value *All*. Leaving the field blank prevents the rule from searching across all records of that type, improving the scalability performance of product attribute rules. For example, the Product scope can be specific for product value, while leaving **Product Family** and **Product Group** blank, so that they are not queried because they are not needed.

10. Fill in the fields under the **THEN(statements)...** to define the Product Attribute Rule.

Field Name	Description
Target Attribute	Select the target attribute. Use type ahead to display a list of applicable fields or attributes.
Action Type	<p>Select the action that you want to perform on the product attribute. Available options are:</p> <ul style="list-style-type: none"> • Allow - To restrict the visibility of values on the target field. • Default - To add a default value on the target attribute. • Hidden - To hide the target attribute. • Disabled - To make the target attribute as a read-only field. • Required - To make the target attribute as a required field. • Reset - To auto-populate a default value on the target attribute if the field is left blank. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Click the relevant link to see the individual examples.</p> </div>

Field Name	Description
Value Expression	<p>Enter the Value Expression. You can use the methods such as JOIN and DISCRETEINTERVAL.</p> <p>DISCRETEINTERVAL(start, stop, interval): This method returns a discrete array of values from start to stop separated by interval.</p> <p>Params:</p> <ul style="list-style-type: none"> • start - the first element of the specified dimension in the array • stop - the last element of the specified dimension in the array • interval - the distance between two elements in the array <p>JOIN(array, separator): This method returns a concatenated text string of all the elements of an array, using the specified separator between each element.</p> <p>Params:</p> <ul style="list-style-type: none"> • array - an array that contains the elements to concatenate. • separator - the string to use as a delimiter between values. Separator is included in the returned string only if the value has more than one element. If no separator is specified, the default will be a comma (,). <p>For example, if you want to limit the deductible amount (an attribute) for California state from 200 to 1000, with an interval of 100, use the expression as: <code>JOIN(DISCRETEINTERVAL(200,1000,100),';')</code></p>

- Click **Save**.

 Once you save your record, update the **Target Attribute** with the prefix `Apttus_Config2__ProductAttributeValue__c`. For example, if your **Target Attribute** is `ProductAttributeValued1__r.Ext1Multiselect__c`, after the update, your **Target Attribute** should be `Apttus_Config2__ProductAttributeValue__c.ProductAttributeValued1__r.Ext1Multiselect__c`. This up-gradation is required to work with [PAV Extension Objects](#).

Allowing Values Conditionally for a Picklist or Multi-Select Picklist Attribute

Attribute-Based Configuration allows you to create the dependency for the target attribute. You can configure if you want to allow the attribute values based on a condition. The constrained value should be derived from a value expression, for example, can be

pulled from a product field. This helps in providing only a relevant set of attributes for the user to make selections, thus providing a guided experience for configuration.

The following table displays the data types on which you can perform this action and the value of Value Expression required.

Action	Data Types supported	Value Expression
Allow	Picklist Multi-picklist	The values to be allowed. 'Red;Blue;Black;Orange' For example, '2014;2012;2015'

For example, Amttus, a leading laptop manufacturer, wants to use attributes to drive the product selection of their users. A laptop has five attributes - Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

The following table describes scenarios where you can use this feature.

Scenario	Target Field	Value Expression
When the user selects White color, you want to allow Yes as a Fingerprint reader attribute.	Laptop Fingerprint Reader	'Yes'

Configuring Default Values Conditionally for Attributes

Attribute-Based Configuration allows you to create the dependency for the target attribute if that attribute should conditionally have a default value set. This feature helps provide starting point configurations for the product and reduce the number of clicks for the user.

Note

If you have set a default value of an attribute using numeric expression and you set the default value of the same attribute using Product Attribute Rule, then the attribute will populate the default value that is set by numeric expression. That is, the value mentioned in numeric expression has priority.

Similarly, if you have set a default value of an attribute from Salesforce field and you set the default value of the same attribute using the Product Attribute Rule, then the attribute will populate the default value that is set using the Salesforce field. That is, the value mentioned in Salesforce field has priority.

The default values are set only when the attributes have no value. For example, you have selected *None* as picklist value. If you have set a value manually in your attribute, then the default value does not override it.

Note

When you are setting the default value for the target field, the following points must be kept in mind.

- The default value for number Data Type must be written as mentioned in the field value.
- The default value for text and picklist Data Type must be written between single quotes.
- The default value for multi-picklist Data Type must be written between single quotes and must be separated by a semicolon without any space.

The following table displays the datatypes on which you can perform this action and the value of Value Expression required.

Action	Datatypes supported	Value Expression	Example
Default	Number Text Picklist Multi-picklist	The default value. For example, 'RED'	Number: 79 Text: 'Red' Picklist: 'Blue' Multi-picklist: 'Red';'Black'

For example, Amttus, a leading laptop manufacturer, wants to use the attributes to drive the product selection of their users. A laptop has five attributes: Color, HDD, RAM, Screen Size, and, Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

The following table describes scenarios where you can use this feature.

Scenario	Target Attribute	Value Expression
When the user selects 2 TB from Laptop HDD picklist, Laptop RAM must set 16 as the default value.	Laptop RAM	16
When the user selects Black from Color, 1 TB from HDD, 8 from RAM, and 14 from Screen Size, Laptop Fingerprint Reader must set No as the default value.	Laptop Fingerprint Reader	'No'

To disallow the value to be changed by a user, create a read-only attribute or make it conditionally read-only. For more information on conditionally making an attribute read-only, refer to [Conditionally Make an Attribute as Read-Only](#).

Hiding Attributes Conditionally

Attribute-Based Configuration allows you to create the dependency for the target attribute to either make the attribute conditionally visible or hide the attribute based on other selections. This helps to provide only relevant sets of attributes for the user to make selections, thus providing a guided experience for configuration.

The following table displays the data types on which you can perform this action and the value of Value Expression required.

Action	Datatypes supported	Value Expression
Make Hidden	Number Text Picklist Multi-picklist	

For example, Amttus, a leading laptop manufacturer, wants to use the attributes to drive the product selection of their users. A laptop has five attributes: Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

The following table describes scenarios where you can use this feature.

Scenario	Target Attribute	Value Expression
When the user selects 4 from RAM, you want to hide the Screen Size attribute.	Screen Size	
When the user selects Black from Color and 1 TB from HDD, you want to hide the RAM attribute.	RAM	

Configuring Attributes Conditionally as Disabled

Attribute-Based Configuration allows you to create the dependency for the target attribute if that attribute should conditionally be marked as *Disabled*. This feature prevents the the user from changing a value of an attribute.

The following table displays the data types on which you can perform this action and the value of Value Expression required.

Action	Data Types supported	Value Expression
Disabled	Number Text Picklist Multi-picklist	

For example, Amttus, a leading laptop manufacturer, wants to use attributes to drive the product selection of their users. A laptop has five attributes: Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

The following table describes scenarios where you can use this feature.

Scenario	Target Attribute	Value Expression
When the user selects Black from Color, 1 TB from HDD, 8 from RAM, and 14 HD from Screen Size, the Fingerprint Reader must be disabled.	Laptop Fingerprint Reader	

Configuring Attributes Conditionally as Required

Attribute-Based Configuration allows you to create the dependency for the target attribute if an attribute must be made conditionally mandatory while selection. This helps to prevent the user from missing any important attribute that must be entered.

The system will auto-select the remaining value if only one value is remaining in a **Required** attribute after the constraints are fired through a matrix or a product attribute rule.

The following table displays the data types on which you can perform this action and the value of Value Expression required.

Action	Datatypes supported	Value Expression
Make Required	Number Text Picklist Multi-picklist	

For example, Amttus, a leading laptop manufacturer, wants to use the attributes to drive the product selection of their users. A laptop has five attributes: Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

The following table describes scenarios where you can use this feature.

Scenario	Target Attribute	Value Expression
You want to ensure that the user selects Screen Size.	Laptop Screen Size	

Resetting Attributes Conditionally

Attribute-Based Configuration allows you to create the dependency for the target attribute to conditionally reset an attribute based on other selections. This helps in ensuring a default value to be added to the target attribute if the user leaves the attribute blank or null. If the user does not select any value in the attribute, the default value be selected by default.

The following table displays the datatypes on which you can perform this action and the value of Value Expression required.

Action	Datatypes supported	Value Expression
Reset	Number Text Picklist Multi-picklist	The default value. For example, 'White' .

For example, Amttus, a leading laptop manufacturer, wants to use the attributes to drive the product selection of their users. A laptop has five attributes: Color, HDD, RAM, Screen Size, and Fingerprint Reader. The following table describes the products and its attributes.

Product	A-560	A-560m	A-440	A-440m	A-320	A-320m
Color	Black	Black	White	White	Black	White
HDD	1 TB	2 TB	500 MB	500 MB	1 TB	1 TB
RAM	8	16	4	8	8	16
Screen Size	14 HD	14 HD	15	15 HD	14	14 HD
Fingerprint Reader	Yes	Yes	Yes	Yes	No	Yes

The following table describes scenarios where you can use this feature.

Scenario	Target Attribute	Value Expression
When the user selects Black from Color, 16 from RAM, 14 HD from Screen Size, and Yes from Fingerprint Reader, you want to reset the value of HDD to 2 TB.	Laptop HDD	'2 TB'

Scenario to Use Product Attribute Rules with Criteria

Product Attribute rules (PAR) effective date based on quote dates

When the effective date of the quote on the product configuration page fulfills the PAR criteria that you defined, a Rule gets executed.

For example,

Rule Criteria: Apply rules where,

Rule Start Date <= Quote Expected Start Date AND Rule End Date >= Quote Expected End Date Date

PAR Effective Date	PAR Expiration Date	Effective Date (On Product Config)	Result
01-11-2017	30-11-2017	15-11-2017	Rule is getting applied
01-11-2017	30-11-2017	31-10-2017	Rule is not getting applied

Managing Pricing

Pricing enables you to rapidly set up pricing structures. Pricing comprises of price lists and price list items. A price list controls which products are visible to the end user. A price list contains several price list items; each linked to a product. You can associate price lists to a product and create price list items for products at the product level as well. You cannot create a price list at the product level.

 Most of the pricing features are available **Admin UI**. However, some features are currently not available in **Admin UI**. In such cases, you must use **CPQ Console**.

Managing Price Lists and Price List Items

Pricing enables you to rapidly set up pricing structures. Pricing comprises of price lists and price list items. A price list controls which products are visible to the end user. A price list contains several price list items; each linked to a product.

You can simply select options and have them priced completely accurately reflecting the latest price lists and discounting rules. You can price any products or bundles based on features or options selected. You can set up pricing rules, constraints, dependencies and extraneous variables.

In the following sections:

Creating Price Lists

Price lists are containers of price list items. Price lists can also have a currency set if your environment is multi-currency enabled.

Price lists are associated with categories so that an end user can view and select products from the shopping cart. For example, Price list A is associated with Category B, when you select price list A on the Quote/Proposal Edit page, only category B and associated products are displayed in the shopping cart.

You can create a price list at any time; however, it is most efficient to create a price list before creating products to easily associate the products with the price list.

To create a price list

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**.
3. Click **New PriceList**.
4. Enter the following details and click **Save**.

Field	Description
PriceList Name	Enter the name of the price list. This is a mandatory field.
Short Description	Enter a description for the price list.
Is Active	Move the slider to the right to enable the price list.
Effective Date	Select a date from when the price list must be effective.
Expiration Date	Select a date in the calendar on which the price list should be expired or made inactive.
Based on Price List	<p>Select the name of an existing price list depending on which the new price list is created.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> This field is useful in scenarios such as your organization wants to sell the same products in different currencies or in the same currency with some discount.</p> <p>For example, your organization sells products in the United States in the USD currency. You have created a price list called USD Price List. For all products, you have created the required price list items, which are associated with USD Price List. Now you want to sell the same products in Great Britain in the GBP currency. You can create another price list with the following details:</p> <ul style="list-style-type: none"> • PriceList Name: GBP Price List • Currency: GBP - British Pound • Based On Price List: USD Price List <p>If you sell a product that costs 1 USD in the Unites States, the price of it will be converted to GBP based on the currency conversion rate defined at Setup > Company Profile > Manage Currencies. In this way, you can create a price list based on another price list, without creating corresponding price list items.</p> </div>

Field	Description
Based on Adjustment Type	<p>Select the type of adjustment. The following adjustment types are available:</p> <ul style="list-style-type: none"> • % Discount: If the Sales Rep applies a % discount type of adjustment, the List Price is discounted by a percentage specified in the adjustment amount field. The new amount is stored on the cart line item. • Discount Amount: If the Sales Rep applies a discount amount of adjustment, the List Price is discounted by a percentage specified in the adjustment amount field. The new amount is stored on the cart line item. • % Markup: If the Sales Rep applies a percentage markup of adjustment, the List Price is increased by the percentage specified in the % Markup field. The new amount is stored on the cart line item. For example, if you want to increase the price of laptops during the month of September, you can apply a markup amount or a percentage markup that adds to the List price. • Markup Amount: If the Sales Rep applies a markup amount of adjustment, the List Price is increased by the amount specified in the markup amount adjustment field. The new amount is stored on the cart line item. • Price Factor: This is a multiplier. Select this and enter an amount in the Based on Adjustment Amount field. Using this price factor, CPQ multiplies the List Price on the cart.
Currency	<p>Click the drop-down list and select the currency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> The currency defined in the price list overrides the currencies that you define in other objects such as price list item, product, quote, quote line item.</p> </div>
Based on Adjustment Amount	<p>Enter a value based on the adjustment type that you have selected.</p>

Field	Description
Type	Select the type of Price list from the drop-down list. The following price list types are available: <ul style="list-style-type: none"> • Standard: Select standard price list if the quote derives its pricing from price list and its related price list items configured in the CPQ solution. • Contract: Select contract price list if the quote derives its pricing from an agreement. You must also associate a contract number when you select this price list.
Account	Associate an account with the price list.
Cost Model	Search and select a cost model. A cost model is a container holding all cost types (parent and child cost types). You can associate one cost model with multiple price lists. However, one price list can have only a single cost model associated with it. For more information, see Defining Cost Models and Associating Cost Models with a Price List .
Owner	Enter a name of the owner for Pricing activities.
Contract Number	Enter a contract number to which you want to associate this price list. This enables contract pricing in CPQ.

A price list is created and saved. You can associate all related pricing, products, and options with them.

Associate a Price List with Categories

Price list must be associated to an Offering category for the products to be displayed on the catalog.

The ASSOCIATED CATEGORIES tab on the price list displays the category associated to it and this category is displayed to the end user in the shopping cart. In this way, you can control the display of products by category.

Prerequisites

You must have an existing offering category and a price list.

To associate price list to a category

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**. A list of existing price lists is displayed.
3. Select a price list and click the **ASSOCIATED CATEGORIES** tab.
4. From the All Categories pane, drag and drop the required categories to the associated categories pane.
5. Click **Save**.

The price list is associated with a category.

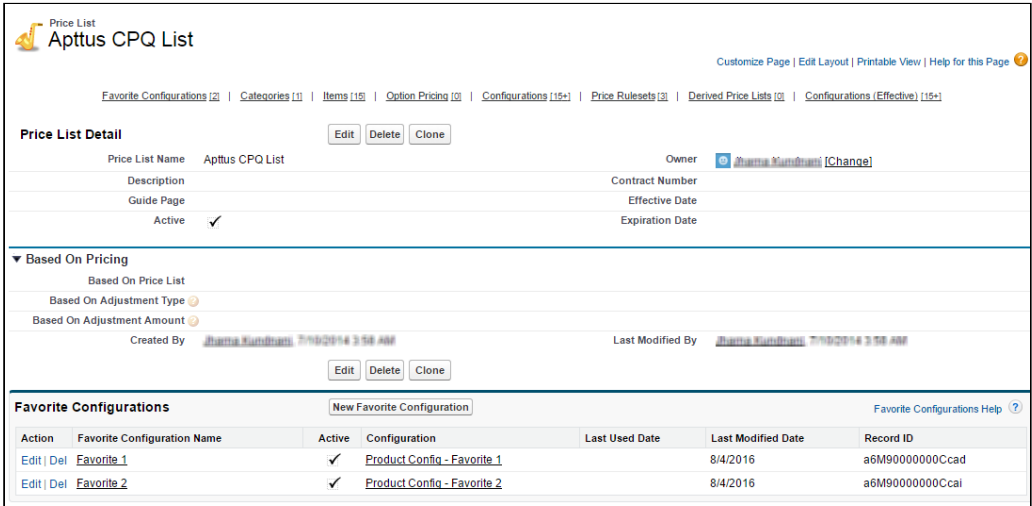

Viewing and Publishing Favorite Configurations for a Price List

After the Sales rep saves the favorite configurations, as an admin, you can view these favorite configurations collectively under a Price List. The favorite configurations are always linked to the Price List and after you associate this Price List to your Quote/ Proposal, a separate category, named **Favorites**, containing your favorite configurations is displayed on the Catalog page.

You can do the following customizations on favorite configurations:

- Associate an image
- Customize the label of your favorite category
- Customize the fields that should be displayed to the sales reps on the catalog page
- Customize the columns to be displayed on the **Save as My Fav** dialog box on the cart.
- Disable the favorite configuration related UI elements.

For more details, see [Configuring Favorite Settings](#).

The **Publish** button on your favorite configuration record allows you to publish a favorite configuration record to another price list. This is useful when you want to use the same configuration records across a number of price lists.

Ensure that you have configured [Configuring Lookup Field Settings](#) with the values as described in the image below before publishing your favorites to another price list.

Creating Price List Items

Price List Items contain detailed pricing information about a product.

A product can be set up with one or more price list items. Each price list item includes the list price for the product including details of charges such as per unit, flat price, one time, recurring, and more. All the fields on a price list item are price related and impact the final price on the shopping cart. Each price list item represents different ways, a customer is charged for a product. For example: License fee, Implementation fee, and more. Price list items are categorized into price lists.

To create a price list item

-  If a field is not available in the Admin UI, you must use CPQ Console to configure it.
1. Navigate to the **CPQ Console** tab.
 2. Click **Manage Price Lists** and select an existing price list.
 3. Scroll down to the Items related list, and click **New Item**.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**. A list of existing price lists is displayed.
3. Select a price list and click the **PRICELIST ITEMS** tab.
4. From the Products pane, drag and drop the required product to the right side.
5. Enter details in one or more of the following fields:

Field	Description
Charge Type	<p>Select a charge type. These are a separate, identifiable element of charges that can be used for pricing. For example: Standard Price, Maintenance Fee, Installation Fee, and more.</p> <p>This is a way to capture multiple types of fees for a product or line item. For instance, a product has a product fee but can also have a separate fee for installation. In such a case, you will create two price list item entries for the same product (by clicking the ) and specify the charge type for each one of the two entries. The charge type will be automatically added to the cart when you add the product so that all charges associated with the product are included in the pricing.</p> <p>Apttus does not recommend setting up the bundle and its option to have different frequencies with the same charge type.</p>
List Price	Type a list price for a product in the price list item. If the price list item has matrices or may be overridden, enter 0 as the list price.
Price Type	<p>Select <i>One Time</i>, <i>Recurring</i>, or <i>Usage</i>. Selecting <i>Recurring</i> or <i>Usage</i> enables the Frequency field. For instance, if you add a subscription product, you will choose type as recurring and then specify the frequency as monthly, yearly, and so on.</p> <p>Example: You charge 1\$ per month for a term of 1year, the price is calculated accordingly.</p>

Field	Description
Frequency	This is based on your selection from the Price Type field. Select an option to indicate how often the product will be charged.
Price Method	<p>Select one of the following:</p> <ul style="list-style-type: none"> • Per Unit: Multiplies the price with the quantity. • Flat Price: Applies a flat price. • Percentage: Enables the Percent, Percent Applies To, Related Price List Item fields. • Related Price: Used when the price is calculated as a function of the price of other lines in the same shopping cart. • Tiered Rate: Default price method for Usage Price Type. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i If you select <i>Usage</i> in the Price Type field, you must ideally select <i>Tiered Rate</i> in the Price Method field. This is the right combination for the Price Type and Price Method fields. CPQ does not prevent you from creating other combinations, but you might not get appropriate results.</p> </div>
Active	To make the price list item active, select this check box.
Charge Type Criteria	<p>Click the  icon and configure a charge type criteria and click Save.</p> <p>This is used for conditional charge types that are included only if a certain criteria is met and as part of adding the main product to the cart. Setting this criteria either by Line Item or Attribute field will only apply this price list item under those conditions. For example, this may be a charge type based on workstations; whereas the product may have a charge type based on users.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i A product should have at least one Price List Item without any charge type criteria, only then the pricing happens to the product in the Cart.</p> <p>If you are using the Charge Type Criteria setting, you must define a criteria for all PLIs. Ensure that you do not define that same criteria for more than one PLI. The criteria must be mutually exclusive so that CPQ does not apply two PLIs while pricing a product.</p> </div>

Field	Description
Percent, Percent Applies To, Related Price List Item	These allow you to set price dependencies such that one price is a percentage of the unit or extended price of another product. Refer Configuring Related Pricing for more information.
Description	Type a brief description to specify the purpose of the price list item.
Price Uom (Unit of measure)	Select an option to specify the unit price you are charging is for an hour, day, year, and so on. This helps the end user while pricing products in the cart. You can modify this in the price list item object.
Min Price/Net Adj %	<p>Enter the minimum price or minimum net adjustment percentage. If the adjustment is a discount, use a negative number (for example, -5)</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i When you select an option from the Min/Max Price Applies To drop-down, the pricing engine considers the value you enter in this field as the minimum price of the product.</p> <p>When Min/Max Price Applies To = <i>None</i>, the pricing engine considers the value you enter in this field as the minimum net adjustment percentage.</p> <p>The minimum limit is not applicable to manual adjustments.</p> </div>
Max Price/Net Adj %	<p>Enter the maximum price or maximum net adjustment percentage.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i When you select an option from the Min/Max Price Applies To drop-down, the pricing engine considers the value you enter in this field as the maximum price of the product.</p> <p>When Min/Max Price Applies To = <i>None</i>, the pricing engine considers the value you enter in this field as the maximum net adjustment percentage.</p> <p>The maximum limit is not applicable to manual adjustments.</p> </div>

Field	Description
Min/Max Price Applies To	<p>Select one of the following:</p> <ul style="list-style-type: none"> • <i>Base Price</i> - This is the derived price for a product when you add it to the cart. This can be same as the list price or different from the list price, if you have defined a price matrix or a price rule that dynamically arrives at the price of the product based on other factors. • <i>Base Extended Price</i> - This is derived by Base Price * Quantity * Term. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> When you select an option from the Min/Max Price Applies To drop-down, the pricing engine considers the value you enter in the Min Price/Net Adj % or Max Price/Net Adj % field as minimum or maximum price of the product.</p> <p>When Min/Max Price Applies To = <i>None</i>, the pricing engine considers the value you enter in the Min Price/Net Adj % or Max Price/Net Adj % field as a minimum or maximum net adjustment percentage.</p> </div>

Apttus Pricing Engine does not support custom values for **Price Type**, **Frequency** and **Price Method** at the Price List Item level or in the Pricing Callback classes. Using custom values may cause unexpected system behavior.

6. Click **Save**. A price list item is created for a product or option. The price list items created display the products and options to the end user in the pricing cart page.

- ✓ Apttus CPQ uses charge types as the consolidation factor for grouping. Such grouping can be at the bundle level, Summary Group level, or Sub-total level. In this way, we ensure that the line items with the same **Charge Type** and **Frequency** calculate the following fields on the Cart appropriately:
 - Selling Term
 - Adjustments applied on a bundle line or a Summary group line

- [Adjusting Options Pricing for a Bundle Manually](#)

The Options tab display the option product and associated price for a bundle. You can control how the options price rollup to the bundle price. You can also control the display of options adjustments on the pricing cart page.

- [Applying Price Matrices from the Matrices Tab](#)

If the product has a matrix based price, click the Matrices tab.

- [Applying the Default Pricing to Products](#)

You can apply default pricing to a product from the Defaults tab.

- [Defining Tax and Billing for Products](#)
You can define the way your product should be billed and taxed from the Tax & Billing tab.
- [Applying Miscellaneous Pricing to Products](#)
You can apply miscellaneous pricing to a product from the Miscellaneous tab.
- [Configuring Charge Type Frequency as Weekly](#)
Products can now be configured to have recurring charges with a pricing frequency set as weekly. The customer would then be charged based on the number of weeks between the start and end dates of the product.

Adding Additional Details to a Price List Item

1. Select an existing price list item, click the more icon () , and click **Advanced**.
2. Click the **DETAILS** tab.
3. Enter the following details:

Field	Description
Price List	Displays the price list, which is disabled for editing.
Charge Type Criteria	<p>Click the  icon and configure a charge type criteria and click Save.</p> <p>This is used for conditional charge types that are included only if a certain criteria is met and as part of adding the main product to the cart. Setting this criteria either by Line Item or Attribute field will only apply this price list item under those conditions. For example, this may be a charge type based on workstations; whereas the product may have a charge type based on users.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> A product should have at least one Price List Item without any charge type criteria, only then the pricing happens to the product in the Cart. If you are using the Charge Type Criteria setting, you must define a criteria for all PLIs. Ensure that you do not define that same criteria for more than one PLI. The criteria must be mutually exclusive so that CPQ does not apply two PLIs while pricing a product.</p> </div>

Field	Description
Product	Search and select a product.
Charge Type	Select a charge type. These are a separate, identifiable element of charges that can be used for pricing. For example: Standard Price, Maintenance Fee, Installation Fee, and more.
Active	To make the price list item active, turn on the toggle button.
Sequence	Enter a sequence for the price list item.
List Price	Type a list price for a product in the price list item. If the price list item has matrices or may be overridden, enter 0 as the list price.
Cost	Type a cost of a product. <div data-bbox="651 920 1426 1323" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> You can set the cost in the price list currency. If the quote price list is in a different currency, the sales user will see the cost with the correct conversion rate applied. The subsequent fields of cost such as base cost, base extended cost, and extended cost are calculated after the currency conversion. If the Disable Based On Currency Adjustment setting is enabled on the price list, the currency conversion is not applied.</p> </div>
Effective Date	Enter an effective date for the price list item.
Expiration Date	Enter an expiry date for the price list item.
Price Type	Select <i>One Time</i> , <i>Recurring</i> , or <i>Usage</i> . Selecting <i>Recurring</i> or <i>Usage</i> enables the Frequency field. For instance, if you add a subscription product, you will choose type as recurring and then specify the frequency as monthly, yearly, and so on. Example: You charge 1\$ per month for a term of 1year, the price is calculated accordingly.
Frequency	This is based on your selection from the Price Type field. Select an option to indicate how often the product will be charged.

Field	Description
Price Method	<p>Select one of the following:</p> <ul style="list-style-type: none"> • Per Unit: Multiplies the price with the quantity. • Flat Price: Applies a flat price. • Percentage: Enables the Percent, Percent Applies To, Related Price List Item fields. • Related Price: Used when the price is calculated as a function of the price of other lines in the same shopping cart. • Tiered Rate: Default price method for Usage Price Type. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> If you select <i>Usage</i> in the Price Type field, you must ideally select <i>Tiered Rate</i> in the Price Method field. This is the right combination for the Price Type and Price Method fields. CPQ does not prevent you from creating other combinations, but you might not get appropriate results.</p> </div>

4. Click **Save**.

Adjusting Options Pricing for a Bundle Manually

The **Options** tab display the option product and associated price for a bundle. You can control how the options price rollup to the bundle price. You can also control the display of options adjustments on the pricing cart page.

To manually adjust options pricing for a bundle

You must have an existing price list item.

1. Select an existing price list item, click the more icon () , and click **Advanced**.
2. Click the **OPTIONS** tab.
3. Enter information in one or more of the following editable columns:

Field	Description
Adjustment Amount	<p>Enter an amount to adjust the options price.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> For Optional bundle, if you apply a discount on the bundle level, it is not populated in the Adjustment Amount and Adjustment Type field on the option. Discount is getting applied on the line items, however, Adj Type and Amount fields are not getting populated for line items and Adj Type and Amount field are not getting cleared from the bundle product.</p> </div>
Adjustment Type	Select an adjustment type.
Price Included In Bundle	<p>Select to include the price with the bundle product. Selecting Price Included in Bundle sets the Adjustment Amount to zero and Adjustment Type to Price Override. This means the option price is included in the bundle price and therefore is free.</p>
Allow Manual Adjustment	<p>Select this to enable the end user to make manual adjustments. Manual adjustments are done through the adjustment type and amount fields on the pricing cart page.</p>
Allocate Group Adjustment	<p>Select this to include the product in a manual group discount, if applied, on the pricing cart page.</p>

4. Click **Save**.

The option price for a bundle is adjusted and saved.

Enabled Group Adjustment Spread and Enforced Min/Max Net %

- You can prevent the sales reps from applying any line level adjustments on one or more items in the cart because these items are sold at the price that Apttus CPQ calculates.
- If you have enabled the `Enable Adjustment Spread` custom setting and disabled the `Allow Manual Adjustment` on a line item, then Apttus CPQ sets the `Allocate Group Adjustment` as read-only for that line item. Note that the sales reps cannot use **Mass Update** to update the **Allocate Group Adjustment** flag.
- This feature is based on client side pricing framework, hence you must set `Enable Auto Reprice` to True.
- After configuring the `Min Net %` and `Max Net %` on a price list item, you cannot apply the manual price adjustment outside of Min/Max Net % range.
- You can give percentage-based discounts for configuring a quote with a desired price by using group adjustment spread when you have Min/Max Net % associated with the line items.
- This feature can be used only if the bundle has no price of its own. This is because the allocation of group adjustments is only to the options and the bundle's own price will not be adjusted.
- Ability to set Minimum and Maximum Net Adjustment % is enabled only when "Enable Auto Reprice" is turned ON.

i To use Min/Max Net %, you must ensure that the **Adjustment Applies To** field is empty.

Conversion of Group Adjustments when bundle and options have ramps

Group Adjustment Spread provides you easiness of applying a group adjustment with the flexibility of a line level adjustment. You can update the adjustment type and amount on a bundle or summary group line and on reprice, the group adjustment gets replaced by line level adjustments on the options or standalone products.

Use Case 1:

When the bundle has three ramps with Start Date and End Date as:

Start Date	End Date
1-Jan-2017	31-Dec-2017
1-Jan-2018	31-Dec-2018

Start Date	End Date
1-Jan-2019	31-Dec-2019

Then suppose there are options with ramp lines with the same dates. In that scenario, if you apply an adjustment to one of the ramp lines, only the corresponding ramp line gets adjusted and the other ramp lines remain the same. If a bundle does not have ramps, but the options have ramps in that case adjustment spreads to all the ramp lines.

Use Case 2:

If a bundle has a total price of \$600, price override of \$300, and one of the options has three ramp lines with extended prices of \$100 each, then each of the option gets a price override of \$50 (assuming all the options of the bundle are eligible and the corresponding option has flat rollup method).

- You can use the Group Adjustment Spread functionality even if the bundles have sub-bundles.
- Group Adjustment Spread functionality works for Discount Amount, Markup Amount and Price Override as well for the conversion of amount-based bundle adjustments to option adjustments.
- You can quickly apply adjustments using the Group Adjustment Spread functionality, although you have optional cart line items.

Applying Price Matrices from the Matrices Tab

If the product has a matrix-based price, click the Matrices tab.

A price list item can have more than one matrix evaluated in a sequence. For more information, see [Defining or Creating Price Matrices](#).

In order to work with matrix-based pricing, you must [create price dimensions](#) for a product. You can create up to six dimensions, bringing in attributes from the line item or header objects of any data type within Salesforce. The dimension value type has three values: Discrete, Range, and Cumulative Range - Line Item.

Applying the Default Pricing to Products

You can apply default pricing to a product from the Defaults tab. This tab enables you to apply default quantity and pricing to a product.

To apply default pricing to a product

You must have an existing price list item.

1. Select an existing price list item, click the more icon () and click **Advanced**.
2. Click the **DEFAULTS** tab.
3. Enter the following details:

Field	Description
Default Quantity From	Select an option from where default quantity is to be considered. If the price list item derives its default quantity from a specific attribute, when the user navigates to the catalog page and selects a product and its attribute, the default quantity of the product is derived based on a number selected from an attribute of type picklist or number.
Default Quantity Field	This field is dependent on the Default Quantity From field. Select the Product Attribute using which the default quantity of the product is derived.
Default Quantity	Enter the default quantity.
Default Price From	Select an option from where default price can be considered. Supported values are: <ul style="list-style-type: none"> • Advanced Formula • Product Attribute
Default Price Field	Enter the name of the CPQ formula field (it can be normal or based on numeric expression) and select it from the search result. Whatever the value this field returns, that will be the list price of the product. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> You must have selected <i>Advanced Formula</i> in the Default Price From for this field to work.</p> </div>
Default Selling Term	Enter the default selling term. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> If a product has two PLIs of Recurring type and PLI 1 has Default Selling Term mentioned on it while PLI 2 does not have Default Selling Term. Then on product configuration, the selling term of PLI 2 gets autoupdated in line with selling term of PLI 1.</p> </div>

Field	Description
Auto Update Quantity	Select to automatically update the quantity on the Cart. This is useful when the quantity of your product is derived using a Numeric Expression and you want to reflect the changes made by the Numeric Expression on the Cart automatically.
Auto Cascade Quantity	Select to automatically cascade quantity.
Is Quantity Read Only	Select this to make the Quantity field non-editable on the cart.
Auto Cascade Selling Term	<p>Select to automatically cascade selling term.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Suppose you have one bundle with two options. Option 1 has Auto Cascade Selling Term set to False. Option 2 has Auto Cascade Selling Term set to True. When you add the bundle and both options to the cart and change bundle selling term, then selling term of Option 1 changes although it has Auto Cascade Selling Term set to False.</p> </div>
Is Selling Term Read Only	Select this to make the Selling Term field non-editable on the cart.
Auto Renew	<p>Select this setting only when you want CPQ to automatically close the renewal quote that has an asset with Auto Renew = True. On the expiry date of the asset, CPQ automatically processes the renewal quote and renews the asset for the next term. The quote will be automatically set to <i>Accepted</i> without any intervention (this is called <i>Touchless Renewal</i>). This setting is used to group assets into different renewal quotes, along with the Renewal Group Fields.</p> <p>CPQ allows you to configure this setting at the price list item level, which will cascade to the cart and asset level.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Do not use this setting to create auto renewal quote.</p> </div>

Field	Description
<p>Auto Renewal Type</p>	<p>CPQ allows you to configure an asset as renewable or non-renewable at the price list item level. The supported values are:</p> <ul style="list-style-type: none"> • <i>Fixed</i>: Select this option to make the asset renewable. CPQ can pull the product into Auto and OnDemand renewal quotes. • <i>Evergreen</i>: Select this option to define the selling term without an expiration date. This option makes the asset billable forever until the subscription is cancelled (evergreen billing). For example, if the product is of monthly subscription type, the customer keeps receiving the bills for the asset monthly (without requiring renewals). You cannot pull the product into an Auto or OnDemand renewal quote. For such assets, CPQ disables the Renew action on the Installed Products page (Sales Representative cannot renew the asset manually also). <div data-bbox="638 936 1426 1061" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p> Asset-Based Ordering is not supported for Evergreen assets.</p> </div> <ul style="list-style-type: none"> • <i>Do Not Renew</i>: Select this option to disable CPQ from pulling the asset into Auto or OnDemand renewal quotes. This value makes the asset non-renewable. <div data-bbox="513 1200 1426 1406" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p> If you do not select any option for Auto Renewal Type, CPQ considers the asset as renewable. CPQ allows you to configure this setting at the price list item level, which will cascade to the cart and asset level.</p> </div>
<p>Auto Renewal Term</p>	<p>Enter the a value to define the auto renewal term that CPQ must consider while renewing assets. If you do not specify any value, CPQ considers the Default Renewal Term specified in Installed Product Settings. If both Auto Renewal Term and Default Renewal Term are null, CPQ considers the selling term on the original asset during renewal.</p> <p>CPQ allows you to configure this setting at the price list item level, which will cascade to the cart and asset level.</p>

4. Click **Save**. Default pricing is applied and saved.

Defining Tax and Billing for Products

You can configure all Billing and Tax related information for your product from the Tax & Billing tab.

To define Taxes and Billing

You must have an existing price list item.

1. Select an existing price list item, click the more icon () , and click **Advanced**.
2. Click the **TAX & BILLING** tab.
3. Enter the following details:

Field	Description
Taxable?	Select this check box if the order is a taxable product or service.
Tax Inclusive?	Select the check box if the price of the product is inclusive of taxes.
Tax Code	Lookup to select the relevant tax code.
Billing Rule	Select one of the following options <ul style="list-style-type: none"> • Bill in Advance - To bill your customer before the product is delivered • Bill in Arrears - To bill your customer after the product is delivered • Ready for Billing Date - To bill your customer on the Ready for Billing Date you defined for the Order Line Item • Payment on Receipt - To bill your customer when the invoice is presented
Billing Frequency	Select one of the following options <ul style="list-style-type: none"> • Monthly - To generate a bill once every month • Quarterly - To generate a bill once every three months • Yearly - To generate a bill once every year • Usage - To generate a bill based on usage
Min Usage Quantity	If you defined the Billing Frequency to be usage based, enter a value to set the minimum quantity of billable consumption.

Field	Description
Max Usage Quantity	If you defined the Billing Frequency to be usage based, enter a value to set the maximum quantity of billable consumption.

4. Click **Save**.

Defining Finance and Revenue for Products

You can configure all finance and billing related information for your product from the **FINANCE & REVENUE** tab.

To define finance and revenue

You must have an existing price list item.

1. Select an existing price list item, click the more icon () , and click **Advanced**.
2. Click the **FINANCE & REVENUE** tab.
3. Enter the following details:

Field	Description
Revenue Recognition Policy	Enter a revenue recognition policy associated with a product or service.
Revenue Split Policy	Enter an order revenue split policy associated with a product or service.

4. Click **Save**.

Applying Miscellaneous Pricing to Products

You can apply miscellaneous pricing to a product from the **Miscellaneous** tab.

This tab enables you to do the following:

- You can include an option price in a bundle.
- You can enable price ramps if a product is rampable, and enable commitments.
- You can control if a usage tier can be modified or not.
- You can manually adjust options pricing for a bundle. You can also control how the options price rollup to the bundle price and display of options adjustments on the pricing cart page.

To apply miscellaneous pricing to a product

You must have an existing price list item.

1. Select an existing price list item, click the more icon () , and click **Advanced**.
2. Click the **MISCELLANEOUS** tab.
3. Select the following options as required:

Field	Description
Price Included In Bundle	Select to include the price with the bundle product. Selecting Price Included in Bundle sets the Adjustment Amount to zero and Adjustment Type to Price Override. This means the option price is included in the bundle price and therefore is free.
Enable Price Ramps	Select this check box to make a product price rampable.
Enable Commitment	Select this to enable commitment.
Is Usage Tier Modifiable	Select this check box to enable an end user to modify the usage tier.
Disable Asset Integration	<p>Select to prevent the creation of asset corresponding to this product during the quote process. For now, you can disable asset creation only for standalone products. It is recommended not to block asset creation because it hinders the preferable system flow of asset creation on quote acceptance. Once you install Apttus Billing Management version 4.97 installed or later, order activation continues as billing now ignores any line without an asset id. You cannot see bills created for those orders because there is no asset.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> CPQ does not support suppression of bundle products and does not encourage suppression of standalone products.</p> </div>
Allow Manual Adjustment	Select this to enable the end user to make manual adjustments. Manual adjustments are done through the adjustment type and amount fields on the pricing cart page.

Field	Description
Allocate Group Adjustment	Select this to include the product in a manual group discount, if applied, on the pricing cart page.
Enable Auto Ramp Creation	Select this check box to auto generate ramp line creation for the 2nd charge type, if price ramp is enabled for the first charge type.
Allow Proration	Select to allow proration. On the Cart page, to make Selling Frequency editable by the user, this check box must be selected.
Disable Cost Model	Select this check box to disable cost model and therefore, cost line items are not created when a product is added to the cart.

4. Click **Save**.

Miscellaneous pricing items applied to a product and saved.

Configuring Charge Type Frequency as Weekly

Products can now be configured to have recurring charges with a pricing frequency set as weekly. The customer would then be charged based on the number of weeks between the start and end dates of the product.

To set charge type frequency as weekly

A valid Price List should exist. If you are upgrading from a previous version follow the Post Upgrade Steps: Add the value Weekly to the picklists of the following objects:

Object	Picklist to add the value to
Price List Item	Frequency (Update the Price Type dependency picklist accordingly)
Asset Line Item	Pricing Frequency, Selling Frequency
Line Item	Pricing Frequency, Selling Frequency
Order Line Item	Pricing Frequency, Selling Frequency
Summary Group	Frequency

Object	Picklist to add the value to
Frequency Conversion Rate	From Frequency, To Frequency

1. Create a Price List Item for a Product.
2. Set the **Price Type** as *Recurring*.
3. Set the **Frequency** as *Weekly*.
4. Specify the **List Price** and other requisite fields and click **Save**.

When a product having a charge with frequency as weekly is added to the cart, the term for that charge is calculated based on the number of weeks between the start date and end date. The final price will reflect the term.

Configuring Price Escalators

Price Escalator is a new mechanism to define a markup on the different prices for a product. The markup can be defined on a previous or first ramp line on the cart.

On which prices is it applicable?

The markup is applied on the List Price, Base Price or Extended Price.

Applicable for which products?

The Price Escalator can be applied on Bundle and Option products. Please note that the bundle level escalator does not cascade to the option products.

Where is this applied?

The markup is applied on the first or previous ramp line (defined by the **Period** field) of bundle or option products on the cart.

When is this applied?

For bundle products, the price escalator is applied after the Price Matrices.

For option products, the price of the ramps is calculated depending on the value in the **Product Option Price Order** field.

Usecase

If the matrix gives a base price is 60 and if the YOY ramp markup has been defined as 10% over base price on period 2 and period 3, then the first ramp line will be \$60, second will be \$66 and the third will be \$72.60.

To configure a Price Escalator

1. Navigate to your Price List Item record and search for **Price Escalator** related list.
2. Click **New Price Escalator** and enter the following details:

Field	Description
Period Number	Defines the ramp line number.
Adjustment Source	Defines the ramp on which the adjustment is applied.
Adjustment Applies To	Values for the different prices to which the adjustment is applied. Valid values are List Price, Base Price and Extended Price.
Adjustment Type	Values for manual adjustments whether you want to apply discount or markup on the price.
Adjustment Amount	Field to enter in the amount or percentage of manual adjustment.
Price List Item	This is a lookup to the Price List Item, containing the PLI Id by default.

3. Click **Save**.

Managing Price Rules

In addition to managing prices for products using price lists and price list items, you can manage prices using pricing rules. Pricing rules manage special offers, discounts, and charges at either the line item level or the summary line item level. Many pricing rules can be associated to a Ruleset and through to products.

Price Rulesets are a mechanism to allow particular families, categories or groupings of products to have either line item pricing adjustments applied or summary pricing adjustments applied. Typical examples of these are volume discounting rules or promotional pricing rules.

- [Creating Price Rulesets](#)

Price Rulesets allow for pricing adjustments across a range of products through price rules. Both line item pricing adjustments and summary pricing adjustments can be applied. For example: Discounting rules, promotional pricing, adjustments in aggregate based on a Product Family, and more.

- [Creating Price Rules](#)

You can associate multiple rules to a ruleset or through to a product. Price matrices can be defined in price rules as well as conditional price rules (rules that use boolean logic such as AND/OR). Price rules can be dimensional, which use similar concept as Price Matrices or Conditional, that relate to fields for pricing adjustments.

Creating Price Rulesets

Price Ruleset allows pricing adjustments across range of products through price rules. Price Ruleset manages special offers, promotions and enables discounting based on the specific product attribute. A price ruleset can contain one or more rule entries and it can be dimensional, which employs a similar concept as Price Matrices. You can apply line item pricing adjustments as well as summary pricing adjustments. For example: Discounting rules, promotional pricing, adjustments in aggregate based on a Product Family, and more. Also, if your customer has Gold Rating, and you want to automatically discount specific line items on a proposal by 30%, you should use Price Ruleset.

To create a price ruleset

You must have an existing price list.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Ruleset**.
3. Click **New Price Ruleset**.
4. Enter details in one or more of the following fields, as required:

Field	Description
Price Rule Set Name	Enter a mandatory Ruleset Name and a mandatory Sequence in which the system will evaluate multiple rulesets. Typically, you will perform line item adjustments first and then any summary adjustments
Is Active	Select this to set the ruleset as active.
Enable Currency	Select this to enable currency for the price ruleset.

Field	Description
Currency	<p>Select the currency for the price ruleset.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> If the price ruleset and a line item have different currencies, CPQ applies the currency conversion rate (defined at Setup > Company Profile > Manage Currencies) when applying the rule adjustment.</p> </div>
Short Description	Enter a description for the ruleset.
Effective Date	Not required as long as the price ruleset is Active, but can be used for promotional rules, and more.
Price List	Select a price list. The ruleset will only source product prices with the selected price list and then apply adjustment criteria.
Product Category	Select a category. The ruleset will only source product prices within the selected category.
Category	Select All, Agreement, or Proposal. This indicates if the ruleset is relevant to Agreements, Proposals, or both.
Application Level	<p>Select a level to which this ruleset will be applied. The supported values are:</p> <ul style="list-style-type: none"> • <i>Line Item</i>: Selecting this will apply the line item adjustment within the line item net price in the shopping cart. • <i>Bundle</i>: Selecting this will apply the adjustment to a bundle and its options and the adjustment is displayed in the Totals tab in the shopping cart. • <i>Aggregate</i>: Selecting this enables the Application Method field.
Application Method	<p>This field is enabled if you selected <i>Aggregate</i> from the Application Level drop-down list. This indicates that you want the adjustment to select products in aggregate but apply an adjustment as a summary line in the Totals tab or spread the adjustment over numerous products. The supported values are:</p> <ul style="list-style-type: none"> • <i>Apply to Line Items</i>: Applies the adjustment to line items on the cart. • <i>Create Summary Lines</i>: Applies the adjustment as a summary line in the Totals tab on the cart.

Field	Description
Ruleset Criteria	Allows you to set criteria for a line item rule or a bundle, depending on the Application level you have selected, such that the ruleset only applies when it satisfies a line level field value or a product attribute value. Click New to fill in your criteria.
Stop Processing more Rules	Selecting this indicates that if the ruleset is satisfied, the system will not process any more rules.
Enable Date Range	Selecting this enables you to set the effective date and expiration date on the rule entry.
Expiration Date	Select an expiration date.
Product Family	Select the Product Family. This is the Product Family field on the products object. The ruleset will only source product prices with the selected Product Family.
Product Group	Click to search and select a custom product group to the ruleset will apply the pricing adjustments. These custom product groups have no relation to a category, a Product Family, or any other product designation.
Charge Type	Select a charge type to which the ruleset will apply adjustments.

5. Click **Save**.

By filling out these criteria, the source products and prices are then designated and the ruleset can apply adjustments through price rules.

Creating Price Rules

You can associate multiple rules to a rule set or through to a product. Price matrices can be defined in price rules as well as conditional price rules (rules that use boolean logic such as AND/OR). Price rules can be dimensional, which use a similar concept as Price Matrices or Conditional, that relate to fields for pricing adjustments.

One ruleset can have multiple rules and are evaluated in order of the rule sequence. A rule can be dimensional or conditional. A price rule determines the actual price adjustment made.

To create a price rule

You must have an existing Price Ruleset.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Ruleset**.
3. Select an existing price ruleset.
4. On the **PRICE RULES** tab click **New Price Rule**.
5. On the **DETAILS** tab, enter the following details.
 - a. In **Rule Name**, enter a mandatory rule name.
 - b. In **Short Description**, enter a description for the rule.
 - c. Selecting **Stop Processing More Rules** indicates that if the ruleset is satisfied, the system will not process any more rules.
 - d. From **Rule Type**, select a type. The supported values are *Dimension* and *Condition*. In setting a dimensional price rule, the process is exactly the same as [creating a price matrix](#) for a product.
 - e. From **Adjustment Applies To**, select an option to which the adjustment is applied. This is for line item adjustments only.
 - f. By default, the price rule inherits the value of **Currency**, from the price ruleset.
 - g. The **Sequence** is auto-generated.
 - h. To make the rule active, select **Active**.
 - i. From **Allowable Action**, select an appropriate action for adjustments.
 - j. From **Adjustment Charge Type**, select an option to set summary level adjustments as a charge type. You can change this in the Price Rule object.
 - k. To allow complete removal of a price adjustment, select **Allow Removal of Adjustment**.
6. On the **DIMENSIONS** tab, enter the following details.
 - a. From **Dimension**, select a price dimension. You can enter up to six dimensions, which bring in attributes from the line items or headers of any data type within Salesforce. For example, you can select a dimension on quantity.
 - b. From **Dimension Value Type**, select one of the following:

Option	Description
Discrete	The system only considers the specific matrix values.
Range	The system considers the matrix values as inclusive of the numbers in the range.

7. Click **Save**. The price rule is successfully created and listed under the Price Rule list.

8. Click the add icon (+) in the price rule details section to add an adjustment to the price rule. You can add more than one price rule rows by clicking + and delete rows by clicking -. You can also move a row up or down by clicking ▲ or ▼.
9. Enter the following details and click **Save**.
 - a. In the **<Dimension>** column, enter a value for the dimension you created.
 - b. In the **Adjustment Amount** column, enter a percentage or a number to adjust the price.

i In this column you enter the adjustment amount directly. Use this column if you are not using the **Adjustment Amount Source** column.

- c. In the **Adjustment Type** column, select the kind of adjustment required.
- d. In the **Adjustment Amount Source** column, select an adjustment source.

i Use this column if you are not using the **Adjustment Amount** column. In this column, you can select an adjustment amount that will be fetched from CPQ formula fields created on the required business objects and fields. CPQ fetches the adjustment value from those fields instead of fetching the adjustment amount directly from the **Adjustment Amount** column. However, you must select such formula fields that return only numeric values. CPQ applies the adjustment on the list price to derive the base price.

- e. In the **Effective Date** column, select the date from when the price rule entry will be effective.

i This column is available only if the **Enable Date Range** is turned on. For more information, see [Creating Price Rulesets](#).

- f. In the **Expiration Date** column, select the date on which the price rule entry will expire.

i This column is available only if the **Enable Date Range** is turned on. For more information, see [Creating Price Rulesets](#).

- g. In the **UOM** column, enter the UOM for the price rule entry so that CPQ applies the UOM conversion rate if the price rule entry and the line item have different UOMs.

i You can set the UOM of a price rule entry when the **Adjustment Type** is Discount Amount, Markup Amount, or Price Override. Also, you must have configured the conversion rate for UOMs. For more information, see [Configuring Unit of Measure \(UOM\) and Frequency Conversion Rate](#). The UOM you enter in the price rule entry here must be the source during conversion (**From Uom**).

Creating Price Matrices and Dimensions

Price Matrices are an advanced pricing concept used to define tiered pricing paradigms or complex pricing structures with multiple criteria. Common examples are pricing tiers for a product based on user count or particular customer or transactional dimensions.

- [Creating Price Dimensions](#)

Price Dimensions are an important concept in order to link any field within Salesforce into the pricing tables. Any field that will determine a pricing adjustment such as Quantity, Term, and more, needs a dimension created for it.

- [Creating Price Matrices](#)

These are an advanced pricing concept used to define tiered pricing paradigms or complex pricing structures with multiple criteria. Common examples are pricing tiers for a product based on user count or particular customer or transactional dimensions. A price list can have more than one price matrix.

Creating Price Dimensions

Price Dimensions are an important concept in order to link any field within Salesforce into the pricing tables. Any field that will determine a pricing adjustment such as Quantity, Term, and more, needs a dimension created for it.

To create A price dimension

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Dimensions**. A list of existing price dimensions is displayed.
3. Click **New Price Dimension**.
4. In the **Name** field, enter a mandatory name for the dimension.

5. From the **Context Type** drop-down, select a context type.

 CPQ supports the out-of-the-box context types described in the following table. You can manage these context types at **Setup > App Setup > Create > Objects > Price Dimension (object) > Context Type (custom field) > Values** section.

Context Type	Description
Line Item	<p>Allows you to choose any field on the line item shopping cart. For example: Quantity, Term, and more. When you select this context type, the following fields are enabled.</p> <ul style="list-style-type: none"> • Business Object. This field is populated by default based on the Context Type selection. You cannot modify it. • Field: Select a line item field. • Relation Type: Select a relation type between the context type and the line item field. • Cumulative Dimension: Cumulative Dimension is applicable for Asset operations such as increment quantity. If you want to use a value from another dimension with the current dimension and use the resultant value as the final value, select a <i>Dimension Name</i> from the drop-down. The value from another dimension will be added to the value of the current dimension during evaluation. For example, you are creating a dimension on quantity and want to add the value of existing asset quantity to get the total quantity (Asset Quantity + Current Quantity) value, which will be the value evaluated when your current dimension is evaluated.

Context Type	Description
Product Attribute	<p>Allows you to choose any product attribute that has been associated to a product through an attribute group. From Attribute, click to select an attribute group. When you select this context type, the following fields are enabled.</p> <ul style="list-style-type: none"> • Business Object. This field is populated by default based on the Context Type selection. You cannot modify it. • Attribute Group: Search and select an attribute group. • Attribute: Select an attribute in the attribute group selected above. • Cumulative Dimension: Cumulative Dimension is applicable for Asset operations such as increment quantity. If you want to use a value from another dimension with the current dimension and use the resultant value as the final value, select a <i>Dimension Name</i> from the drop-down. The value from another dimension will be added to the value of the current dimension during evaluation. For example, you are creating a dimension on quantity and want to add the value of existing asset quantity to get the total quantity (Asset Quantity + Current Quantity) value, which will be the value evaluated when your current dimension is evaluated.

Context Type	Description
Custom	<p>Allows you to define a custom syntax for CPQ to retrieve the value of a field. It is most commonly used to retrieve Quote or Agreement Header fields.</p> <p>This is always from the context of the Line Item, so the format for the fields must be:</p> <p>For Quote Header fields:</p> <pre>Apttus_Config2__ConfigurationId__r.Apttus_QPConfig__ProposalId__r.INSERTYOURFIELDAPINAMEHERE</pre> <p>-or-</p> <p>For Agreement Header field:</p> <pre>Apttus_Config2__ConfigurationId__r.Apttus_CMConfig__AgreementId__r.INSERTYOURFIELDAPINAMEHERE</pre> <div data-bbox="459 943 1426 1066" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p> The field must be the fields API name and not the field label or name.</p> </div> <p>When you select this context type, the following fields are enabled.</p> <ul style="list-style-type: none"> • Business Object. This field is populated by default based on the Context Type selection. You cannot modify it. • Business Formula: Define a formula field. • Cumulative Dimension: Cumulative Dimension is applicable for Asset operations such as increment quantity. If you want to use a value from another dimension with the current dimension and use the resultant value as the final value, select a <i>Dimension Name</i> from the drop-down. The value from another dimension will be added to the value of the current dimension during evaluation. For example, you are creating a dimension on quantity and want to add the value of existing asset quantity to get the total quantity (Asset Quantity + Current Quantity) value, which will be the value evaluated when your current dimension is evaluated.

Context Type	Description
Formula Field	<p>Allows you to create a formula field containing the syntax based on the custom syntax (refer to the context type <i>Custom</i>). You can define a syntax once and can reuse it across multiple price dimensions.</p> <p>There may be scenarios where pricing varies based on Customer Priority status. For example, a customer can have three statuses Gold, Silver, and Platinum. You can define a pricing dimension based on the status of the customer. The Customer Priority field is a custom field you define in the opportunity. You can create a formula field on the <i>Apttus_Config2__LinItem__c</i> object referencing the Customer Priority field. You can later define a pricing dimension for the same formula field and use it within the rulesets to define different pricing tiers for each customer priority.</p> <p>Even though the same Customer Priority field is available in the Line Item context type as well, in scenarios where you have a large number of line items defined with different data types, searching and setting specific values for the context type can be cumbersome. Searching and setting a formula field context type within <i>Apttus_Config2__LinItem__c</i> filters only the fields having formula as a datatype.</p> <p>When you select this context type, the following fields are enabled.</p> <ul style="list-style-type: none"> • Business Object. This field is populated by default based on the Context Type selection. You cannot modify it. • Formula Field: Select a predefined formula field. • Cumulative Dimension: Cumulative Dimension is applicable for Asset operations such as increment quantity. If you want to use a value from another dimension with the current dimension and use the resultant value as the final value, select a <i>Dimension Name</i> from the drop-down. The value from another dimension will be added to the value of the current dimension during evaluation. For example, you are creating a dimension on quantity and want to add the value of existing asset quantity to get the total quantity (Asset Quantity + Current Quantity) value, which will be the value evaluated when your current dimension is evaluated.

Context Type	Description
Asset Line Item	<p>Applicable for Service CPQ.</p> <p>Allows you to choose any field on the asset line item. When you select this context type, the following fields are enabled.</p> <ul style="list-style-type: none"> • Business Object. This field is populated by default based on the Context Type selection. You cannot modify it. • Field: Select an asset line item field. • Cumulative Dimension: Cumulative Dimension is applicable for Asset operations such as increment quantity. If you want to use a value from another dimension with the current dimension and use the resultant value as the final value, select a <i>Dimension Name</i> from the drop-down. The value from another dimension will be added to the value of the current dimension during evaluation. For example, you are creating a dimension on quantity and want to add the value of existing asset quantity to get the total quantity (Asset Quantity + Current Quantity) value, which will be the value evaluated when your current dimension is evaluated. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> For Service CPQ, you must manually add the following values for using a price dimension:</p> <ul style="list-style-type: none"> • Object: Price Dimension (Apttus_Config2__PriceDimension__c) • Picklist Field: Context Type (Apttus_Config2__ContextType__c) • Value: Asset Line Item </div>

Context Type	Description
Asset Attribute	<p>Applicable for Service CPQ.</p> <p>Allows you to choose any asset attribute that has been associated to an asset. When you select this context type, the following fields are enabled.</p> <ul style="list-style-type: none"> • Business Object. This field is populated by default based on the Context Type selection. You cannot modify it. • Attribute: Select an asset attribute. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i For Service CPQ, you must manually add the following values for using a price dimension:</p> <ul style="list-style-type: none"> • Object: Price Dimension (Apttus_Config2__PriceDimension__c) • Picklist Field: Context Type (Apttus_Config2__ContextType__c) • Value: Asset Attribute </div>

6. From the **Type** drop-down, select one of the following types of price dimensions:

i The field **Type** is related to promotions. Based on the selected value, CPQ creates a dimension type for promotion. For example, you can create a quantity-based dimension by selecting *Quantity* from the **Type** drop-down. For more information, see [Creating Price Dimensions for a Promotion](#).

To set up values for the **Type** field, go to **Setup > Create > Objects > Price Dimension (Apttus_Config2__PriceDimension__c) > Type (Apttus_Config2__Type__c)** field.

Type	Description
Amount	Select this if the price dimension is based on purchase amount.
Equipment	<p>Applicable for Service CPQ.</p> <p>Select this value if the price dimension is for Service CPQ.</p>
Quantity	Select this if the price dimension is based on quantity.
Standard	Select this for a standard price dimension.
Term	Select this if the price dimension is based on term.

7. In the **Description** field, enter a description for the price dimension.

8. Click **Save**.

Creating Price Matrices

These are an advanced pricing concept used to define tiered pricing paradigms, or complex pricing structures with multiple criteria. Common examples are pricing tiers for a product based on user count or particular customer or transactional dimensions.

As an administrator, you can associate a cost (custom field) to each price matrix entry because the cost varies with the price and hence the margin is affected. The price matrix entries that are applied on a line item can be accessed in the line item. A price list can have more than one price matrix. CPQ supports multiple matrix entries within a matrix (cumulative range matrix) to be applied.

To create price matrices

You must have existing price dimensions.

1. Select an existing price list item, click the more icon () and click **Advanced**.
2. On the **MATRICES** tab, click **New Matrix**.
3. On the **DETAILS** tab, enter the following details.
 - a. **Matrix Name:** Enter a name for the matrix.
 - b. **Sequence:** Enter a sequence number for the matrix.
 - c. **Short Description:** Enter a description for the matrix.
 - d. **Matrix Type:** Select *Dimension*. If you choose *Condition*, note that the option or attribute pricing at the 1st level sub-bundle is not supported
 - e. **Stop Processing More Matrices:** Select this checkbox to stop the system from evaluating further matrices if a match is found within this matrix.
 - f. **Enable Date Range:** Select this checkbox to enable the start and end date for price matrix to execute.
4. On the **DIMENSIONS** tab, enter the following details.
 - a. From **Dimension**, select a price dimension. You can enter up to six dimensions, which bring in attributes from the line items or headers of any data type within Salesforce.
 - b. From **Dimension Value Type**, select one of the following:

Option	Description								
<p>Cumulative Range - Line Item</p>	<p>The values will be evaluated cumulatively. For example: If quantity = 15 and price is \$1 for a range of is 0-10, and price is \$2 for a range of 11-15, then $10 \times \\$1 + 5 \times \\$2 = \\$20$ will be the price of the product.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p>i As an administrator, you define step pricing so that users (sales representatives) can quote correct prices to customers. You can create a matrix where the Dimension Type is Cumulative Range. If the admin setting <i>APTS_DisableCumulativeQuantityAcrossCart</i> is set to True, CPQ applies the cumulative range matrix such that it does not span multiple line items of the same product. The Admin Setting <i>APTS_DisableCumulativeQuantityAcrossCart</i> is not available in Admin tab by default. You can add the entry by following the steps below:</p> <ol style="list-style-type: none"> i. Go to All Tabs > Admin ii. Click New, to create a new record. iii. Fill the following details <table border="1" data-bbox="962 1240 1402 1597" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Field</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td><i>APTS_DisableCumulativeQuantityAcrossCart</i></td> </tr> <tr> <td>Value</td> <td><i>true or false</i></td> </tr> <tr> <td>Code</td> <td>Leave the field blank</td> </tr> </tbody> </table> <ol style="list-style-type: none"> iv. Click Save. </div> <p>When you have applied <i>Cumulative Range - Line Item price</i> matrix on a product, if you create ramps for that line item, those ramps will have the matrix applied by default. Ramps will inherit the matrix from that line item. (If you create five ramps, all five ramps will have the matrix.)</p>	Field	Value	Name	<i>APTS_DisableCumulativeQuantityAcrossCart</i>	Value	<i>true or false</i>	Code	Leave the field blank
Field	Value								
Name	<i>APTS_DisableCumulativeQuantityAcrossCart</i>								
Value	<i>true or false</i>								
Code	Leave the field blank								

Option	Description
Discrete	The system only considers the specific matrix values.
Range	The system considers the matrix values as inclusive of the numbers in the range.

5. Click **Save**. The price matrix is successfully created and listed under Matrices.
6. Click the add icon (+) in the matrix detail section to add an adjustment to the price matrix. You can add more than one matrix rows by clicking + and delete rows by clicking -. You can also move a row up or down by clicking ▲ or ▼.
7. Enter the following details and click **Save**.
 - a. In the **<Dimension>** column, enter a value for the dimension you created. The values are inclusive. For example, the first line here indicates a range of 0-10. The second line indicates a range of 11-20, etc. All adjustments are adjusting the price list item-list price. To account for an infinite number of values, set the quantity to 999999, which will pull a range of "infinity." In this example, setting 999999 indicates the range 41-999999.
 - b. In the **Adjustment Amount** column, enter a percentage or a number to adjust the price.

 In this field you enter the adjustment amount directly. Use this field if you are not using the **Adjustment Amount Source** column.

- c. From **Adjustment Type**, select the kind of adjustment required, if the criteria is met. An example is an override to a list price, markup, or discount.
- d. In the **Adjustment Amount Source** column, select an adjustment source.

 Use this column if you are not using the **Adjustment Amount** column. In this column, you can select an adjustment amount that will be fetched from CPQ formula fields created on the required business objects and fields. CPQ fetches the adjustment value from those fields instead of fetching the adjustment amount directly from the **Adjustment Amount** column. However, you must select such formula fields that return only numeric values. CPQ applies the adjustment on the list price to derive the base price.

Managing CPQ Formula Fields

While creating a CPQ formula field, you can create an expression using the Apttus Numeric Expressions Framework, so that you can use the formula field for configuring prices and adjustments. You can use the CPQ formula field with numeric expressions while [creating a price rule](#), [price matrix](#), [related pricing](#), and [default pricing](#) (as a list price).

i To use numeric expressions while creating CPQ formula fields, you must add the Picklist value **Expression**, to the Picklist field **Use Type**. Go to **Setup > Create > Objects > Formula Field (CPQ) > Use Type** field.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage CPQ Formula Fields**.
3. Click **New Formula Field**. The **DETAILS** tab is displayed.
4. Enter the following details and click **Save**.
 - a. **Name**: Enter a name for the formula field.
 - b. **Business Object**: Select a business object on which you want to create the formula field.
 - c. **Description**: Enter a description for the formula field.
 - d. **Usage**: Select the type of usage for the formula. Supported values are:
 - **Reference** (default): If you select this option, the **Formula** field is displayed.
 - **Expression**: If you select this option, the **Expression** field is displayed.
 - e. **Formula**: Enter a formula as a text.
 - f. **Expression**: Click the expression lookup. The Edit Expression dialog box is displayed. Configure a formula using numeric expressions and click **Ok**. For more information, see [Configuring Numeric Expressions](#).

Configuring Related Pricing

Related pricing is used when you want to derive the price of a Line Item depending on the price of another Line Item. The Line Item can be of a Standalone, Option or Bundle product. For example, if the maintenance fee of an Option product is 10% of the over all maintenance fee of the main Bundle product, you must create two separate Price List Items for both the products. The Price List Item of the Option product should contain the related pricing fields populated with the values from the Bundle product.

You must perform the necessary configurations at the Price List Item to enable related pricing.

- [Add related pricing information on a Price List Item](#)
- [Create a record in Related Price List Item \(To\) related list](#)

Adding related pricing information on a Price List Item

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**.
3. Click **New PriceList**.
4. Select **Price Method** as *Related Price*.
5. Click the **DETAILS** tab. The different fields used for related pricing, such as **Related Adjustment Amount** and **Related Adjustment Type** are displayed.
6. Enter the following details and click **Save**.

Field	Description
Related Adjustment Amount	<p>Indicates the adjustment amount that you want to apply on the related product. In our example, the value should be 10.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> In this field you enter the adjustment amount directly. Use this field if you are not using the Related Adjustment Amount Source field.</p> </div>
Related Adjustment Type	<p>Indicates the type of adjustment that you want to apply on the related product. Available values are: <i>%Discount</i>, <i>%Markup</i>, <i>Discount Amount</i>, <i>Markup Amount</i>, <i>Percentage</i>, <i>Price Factor</i>, and <i>Price Override</i>. In our example, choose <i>Percentage</i>.</p>
Related Adjustment Applies To	<p>Indicates on which price the adjustments for the related price should be applied. Available values are: <i>Base Extended Price</i>, <i>Base Price</i>, <i>Extended Price</i>, <i>List Price</i>, <i>Net Price</i>, and <i>Net Unit Price</i>. In our example, choose <i>Base Price</i>.</p>

Field	Description
Related Adjustment Amount Source	<p>Indicates the adjustment amount source that you want to apply on the related product.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>i Use this column if you are not using the Related Adjustment Amount column. In this column, you can select an adjustment amount that will be fetched from CPQ formula fields created on the required business objects and fields. CPQ fetches the adjustment value from those fields instead of fetching the adjustment amount directly from the Related Adjustment Amount column. However, you must select such formula fields that return only numeric values. CPQ applies the adjustment on the list price to derive the base price. In our example, if the formula returns 10, CPQ applies 10% discount to the base price of the related product.</p> </div>

Creating a record in Related Price List Item related list

In order to relate two Price List Items and implement related pricing, you must create a record in the Related Price List Item (To) record.

1. Navigate to Related Price List Item (To) related list and click **New Related Price List Item**.
2. Enter the requisite information:

Field	Description
Price List Item	Denotes the ID of the Price List Item for which you are creating this record.
Related Price List Item	Denotes the ID of the Price List Item whose price is used as a basis for the related pricing.
Relation Type	Denotes how the Price List Items are related with each other. Currently, <i>Related Price</i> is supported.

Field	Description
Related Adjustment Amount	Indicates the adjustment amount that you want to apply on the related product. In our example, the value should be 10. You can specify this amount either here or at the Price List Item level.
Related Product	Indicates a filter that you can consider as a source for related pricing. This field must be clubbed with Related Charge Type for correct functioning.
Related Charge Type	Indicates the Charge Type for the Related Price List Item. This should be validated with the Charge Type on the Price List Item record.
Related Product Family	Indicates a filter that you can consider as a source for related pricing. This field must be clubbed with Related Charge Type for correct functioning.
Related Product Group	Indicates a filter that you can consider as a source for related pricing. This field must be clubbed with Related Charge Type for correct functioning.
Related Adjustment Type	Indicates the type of adjustment that you want to apply on the related product. Available values are: Percentage, % Discount, Discount Amount, %Markup, Markup Amount. In our example, choose <i>Percentage</i> .

Currently, the combination with Related Charge Type and Related Price List Item is supported and the combination with Price List Item and Related Price List Item is not supported.

To configure the context for Related Pricing

You can set the related pricing context for Line Items using the custom setting, **Related Price Scope**, available at **Setup > Build > Develop > Custom Settings > Config System Properties > Manage**. This setting enables you to choose if you want to perform the related pricing calculations over the entire Cart or confine the calculations to a Bundle product only. For example, if the price of an Option product is a percentage of another Option product in the same bundle, consider the following scenarios with **Related Price Scope = Cart** and **Bundle**:

- **Related Price Scope = Cart**, the Option price is based on the price of all the instances of the related product in the Cart, whether it is in the same Bundle or a Standalone or in an another Bundle.

- **Related Price Scope** = *Bundle*, the Option price is based on the related product instances within the same Bundle. You must also ensure that the Option products are a part of that bundle.

Enabling Price Ramps

Price Ramps are enhanced pricing methods for service/subscription-based industry.

As an administrator, you must enable price ramps from the price list item details page. Once you enable price ramps, an end-user can create a price ramp for a product to spread pricing across time periods. The user can also create user quantity ramps to define different pricing across different quantities.

 You cannot make a price list item rampable and tierable at the same time. When you have applied *Cumulative Range - Line Item* price matrix on a product, if you create ramps for that line item, those ramps will have the matrix applied by default. Ramps will inherit the matrix from that line item. (If you create five ramps, all five ramps will have the matrix.)

To enable price ramps

You must have an existing price list item.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**. A list of existing price lists is displayed.
3. Select a price list and click the **PRICELIST ITEMS** tab.
4. Select an existing price list item, click the more icon () and click **Advanced**.
5. Click the **MISCELLANEOUS** tab.
6. Select the **Enable Price Ramps** checkbox.
The price becomes rampable for a product. After the price is rampable, you can create and save price ramps from the configuration page and the pricing cart page.

 **Support for Price Ramp on the Cart Grid UI**
Cart Grid UI shows a Price Ramp icon. When you click the icon, it opens an Auto Ramp wizard if you have enabled auto cascade ramp setting on the PLI.

Enabling Auto Ramp Creation

As a sales representative, you might want to auto generate ramp line creation based on general information, like Start Date, End Date, and Term. In the previous releases, when you created price ramps, every line was created individually. Also, the sales representative might want to set up some custom date to adjust charge lines for customers. To address the first scenario, check the **Enable Auto Ramp Creation** under the [Miscellaneous tab](#) on a Price List Item page to enable automatic price ramp on the other charge type.

Consider the following scenarios:

✓ Scenario 1

Consider a scenario where a product has two charge types. When using price ramp on any one of the charge types, the price ramp should be created for the other charge type too. In the previous releases, the system could create a price ramp for only one charge type with the help of an API. This issue has been addressed in the current release, with the introduction of **Enable Auto Ramp Creation** in the Price List Item under the Miscellaneous tab to enable automatic price ramp on the other charge type. If price ramp is created on one charge type with the help of API, the system automatically creates the same price ramp for the other charge type.

✓ Scenario 2

As a sales representative, you might want to auto generate ramp line creation based on general information, like Start Date, End Date, and Term. Also, you might want to set up some custom date to adjust charge lines for customers. To auto generate ramp line creation, check the **Enable Auto Ramp Creation** in the Price List Item page under the Miscellaneous tab to enable automatic price ramp on the other charge type. To set up custom date, you can set the start date, end date, terms and frequency period during ramp creation. You can select the frequency period as 'Monthly', 'Quarterly', 'Yearly' or as 'Custom'. If you select 'Custom' as frequency period, then mention the number of ramps in the text field. The start date, end date, and terms are available when added to the cart. When you click 'save', all the lines are created at the same time. When you select 'Monthly', 'Quarterly', or 'Yearly', the system creates a number of ramps based on Start Date, End Date, and Term. If 'Custom' is selected as the frequency, the system creates a number of lines based on the number of ramps.

To enable Auto Ramp creation

You must have an existing price list item.

1. From CPQ Console, go to your target price list.
2. Under the related list for *Items*, click **Edit** for the required price list item. The Price List Item Edit page is displayed.
3. On the **Miscellaneous** tab, select the **Enable Auto Ramp Creation** check box.

The screenshot shows the 'Price List Item Edit' interface. The 'Information' tab is active, displaying fields for Product (LA Standalone -01), Charge Type (Standard Price), Price List (LA Pricelist 1), and other details. The 'Miscellaneous' tab is selected, showing various configuration options. The 'Enable Auto Ramp Creation' checkbox is checked and highlighted with a red box. Other options include 'Price Included In Bundle', 'Allow Price Ramp Overlap', 'Is Usage Tier Modifiable', 'Allow Manual Adjustment', 'Allocate Group Adjustment', 'Allow Proration', 'Enable Commitment', 'Disable Asset Integration', and 'Disable Sync With Opportunity'.

This auto generates the ramp line creation based on general information, such as Start Date, End Date, Term, and Frequency period.

Enabling Tiered Pricing

Price Tiers enable an end user to view or set up tiers on the configuration page and the pricing cart page. This ensures there are pricing settings (product line item) that determine if tiers can be modifiable or just viewable on the configuration page and the pricing cart page.

You can view existing pricing tiers and adjust pricing on the tier lines (if allowed). This also provides the capability to do tiers per units or usage and also capture additional usage charges for tiers.

If you have defined price matrices, the tiered pricing for a product is inherited from there. If you make any adjustments on the line item that has a tiered rate defined, the adjustments apply to tiered rate and also affect the price matrices.

If you are using usage-based pricing and have a matrix defined, the first dimension should always be a numeric value such as Quantity and not a string value.

 You cannot make a price list item rampable and tierable at the same time.

To enable tiered pricing

You must have an existing price list item.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**. A list of existing price lists is displayed.
3. Select a price list and click the **PRICELIST ITEMS** tab.
4. From **Price Type**, select *Usage*.
5. From **Price Method**, select *Tiered Rate*. If Tiered Rate is not available as a choice, you can [add it to the custom field object](#).
6. To enable a user to modify a usage tier.
 - a. Click the more icon () and click **Advanced**.
 - b. On the **MISCELLANEOUS** tab, select the **Is Usage Tier Modifiable** checkbox.
7. Click **Save**.

Tiered pricing is enabled. If the price list item has tiers defined on the price list already, predefined tiers are displayed on the options/configuration or the pricing cart page. You can create or modify tiers for pricing on the options/configuration and the pricing cart page.

To include a picklist value in an object

1. Navigate to **Setup > Create > Objects**.
2. Click the custom object. For example, click **Price List Item** label next to the Apttus Configuration & Pricing installed package.
3. Scroll down to the Custom Fields & Relationships related list and click the custom field. For example, click the **Price Method** field.
4. Scroll down to the Picklist Values related list and click **New**.
5. Type a picklist value in the text area. For example, *Tiered Rate*.

 You can add more than one picklist values. Each picklist value must be on a separate line.

6. Click **Save**.

A picklist value is added to an object field.

Running a Criteria Maintenance Job

Criteria maintenance is a batch job that must be run whenever changes are made to pricing criteria fields or constraint criteria fields.

This includes:

- Adding or removing criteria in pricing fields.
- Any modification to the price list, price list item, price matrix, price rule, a default rule, or price dimension.
- Adding or removing a constraint rule.
- Adding or removing criteria in constraint rules.
- Any change to the constraint criteria fields.

To run a criteria maintenance job

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. Click the menu icon() on the main menu bar at the top.
3. Click **Criteria Maintenance**. The Criteria Maintenance popup is displayed.
4. To update all pricing criteria fields, click **Update Pricing Fields** or to update all constraint criteria fields, click **Update Constraint Fields**.

This executes an asynchronous batch job that maintains the criteria changes. The administration task is complete and an updated history for all the batch jobs is displayed. The key item to observe is Status. When Completed is displayed it means the job has run successfully, even if the percentage indicator remains at 0%.

Incremental Update for Criteria Maintenance Job

The Criteria Maintenance Jobs are incremental instead of rebuild so that existing records are not impacted.

- When you execute the constraint field maintenance job, Apttus CPQ generates new constraint field records as an insert operation.
- When you execute the pricing fields maintenance job, Apttus CPQ generates new pricing fields records as an insert operation.
- When you execute the expression maintenance job, Apttus CPQ generates new expression records as an insert operation.
- Existing records remain as is.
- Apttus CPQ does not have downtime for quotes with existing records.

Managing Contract Pricing

As a Pricing Administrator, you can store contracted prices in CPQ. The contract pricing feature offers a way to negotiate a price for a product that is not being purchased in the current quote. CPQ uses a set of agreed upon prices for a customer for all the subsequent transactions. CPQ provides the following options to implement contract pricing.

CPQ supports contracted price lists specific to customers. Each customer might have different pricing information. Whenever customers order products or services with the same contracted price list, agreed prices will be given to them.

CPQ can maintain contract price lists (customer specific price lists) to keep a track of negotiated prices for each customer. The customer provides a set of agreed upon prices using an offline process or mechanism. You must set up this information as a price list using the standard CPQ capability. After you set up this price list, any new quote or order coming into CPQ will specify the customer specific price list as the price list on the quote or order.

When to use Contract Price Lists?

- Low customer base: Customer specific price lists make perfect sense, when the number of customers is not huge, as creating customer specific price lists creates a lot of data in CPQ and over a period of time, with changes and renewals, the number can grow exponentially.
- Low number of SKUs in catalog: You must use customer specific price lists when the number of products being negotiated with a customer is of the magnitude of less than 1000 products. If the product catalog contains a large number of products, customer

specific price lists do not offer the flexibility as price programs. In such cases, price programs make better sense.

- Better suited for standalone products: If the product catalog contains a large number of highly complex configurable products, customer specific price lists do not make sense as each product can be configured a lot of different ways.

Contract Pricing is supported for standalone and bundles. Contract Pricing for Options is supported provided options are defined in the same contract price list as the bundle. Options inherit the contract price list from the bundle. If an option is included in two different bundles in a quote, CPQ adds the option twice to the Contract Price List (resulting in two contract price list items). CPQ then applies pricing on the quote based on the selection of the bundle and options, and calculates the price of the option from the price list item that has relation to the current bundle under which it is being configured.

 The contract pricing for bundles works fine for a single-level bundle and same option, however it does not work for same sub-bundles. Contract pricing does not work for when an option is part of different bundles and inherit price from different price lists.

Configuring Contract Price Lists

To enable contract pricing in Apttus CPQ, you must create a price list and store the contract prices. You must set the Type = Contract and associate the price list a *Contract number*.

To configure a contract price list

You must have an existing price list. You must have an existing contract number or agreement number.

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQAdmin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**. A list of existing price lists is displayed.
3. Click **New PriceList**.
4. From the **Type** drop-down list, select **Contract**. The quote derives its pricing from a contract.
5. In the **Contract Number** field, enter a contract number or an agreement number.
6. Enter values in the [required fields](#).
7. Click **Save**.

A contract price list is created.

Defining Contracts to be Used in a Quote

You must define (explicitly) which contracts to be used in quotes.

You can define the contracts to be used in a quote at:

- **Quote Level:** Use a specific contract or a set of contracts to explicitly pass the contract number(s) in the **Configure Products** action. You must create a custom button and add the parameter **cntrNbr_1** to the button formula. CPQ determines the contract pricing for quotes based on the parameter in the cart.
- **Quote Line Item Level:** Sales Representatives can add the contract number at the quote line item level. The **Contract Numbers** field is available on the Line Item record. This applies contract pricing on specific line item only. This parameter is useful when users want to use different contracts for different products. They can apply contract pricing on specific set of products or some other criteria based on condition and not on all products.

When the quote is priced, for each line item, first the price list associated with the first contract on the list is evaluated. If the part is not found on the price list, then the next contract number is evaluated, and so on. If part is not found in any of the price lists associated with the contracts on the list, then the standard price list is used.

Prerequisites

- The contract must be active.
- Contract has the contract number populated and a Price List associated with it (the Related List will have the Price List).
- The contract number on the price list must be the same as the contract number on the Contract.

To define a contract to be used in quote

You must be in the Quote/Proposal object.

1. In **CPQ Console**, go to **Setup > App Setup > Create > Objects**.
2. Scroll down the list and click **Quote/Proposal**.
3. From **Custom Fields & Relationships**, click **New**.
4. From **Data Type**, select **Formula** and click **Next**.
5. Enter a mandatory **Field Label** and press **Tab** on your keyboard, the **Field Name** is auto-populated. For example: In Field Label, enter **Configure Products (Contract**

Pricing), the Field Name is auto-populated with **Configure_Products_Contract_Pricing**.

6. From **Formula Return Type**, select **Text** and click **Next**. The Step 3. Enter formula page is displayed.
7. Type the code in the area displayed and click **Next**. See example code.

Formula Options	
Data Type	Formula
	IF (LEN(Apttus_QPConfig__PriceListId__c) > 0 , HYPERLINK("/apex/Apttus_QPAsset__ProposalConfiguration?id=" &Id& "&cntrNbr_1=CNT-001&cntrNbr_2=CNT-002", IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)

8. On Step 4. Establish field-level security page, make the necessary changes and click **Next**.
9. On Step 5. Add to page layouts page, select the page layout that should include this field and click **Save**.

The **Configure Products (Contract Pricing)** action button is displayed on the Quote/ Proposal page.

Alternately, you can also create a field on the Quote header and enter comma separated contract numbers in that field. Use the following formula text for the Configure Products button. The system automatically looks into contract numbers provided in sequence.

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=" &Id& "&cntrNbr_1="&Contract_price_list_1__c,IMAGE ( "/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)
```

Defining Multiple Contracts to be Used in a Quote

Having multiple contracts on one quote

CPQ supports passing multiple price lists on a Quote/Agreement/Order to see both Non-Contracted and Contracted Products. Sales Representatives may want to display contracted and/or non-contracted products. In this case, you can pass a list of comma-separated contracted price lists (sequence is important because CPQ follows the same sequence as you pass it).

CPQ uses the default price list whenever a user creates a proposal. CPQ creates an account-specific price list when a user creates an agreement. CPQ tries to search if any account specific price list available or not. If the account-specific price list is available, CPQ uses it; if the account-specific price list is not available, CPQ uses the default price list.

 A proposal can have the default price list but the price list item on line item record displays the applied price list item information.

Use Case

A customer has multiple accounts based on locations.

- ABC New York
- ABC California
- ABC USA Operations (parent account)

If you are quoting from ABC New York and a product's pricing is available in ABC USA Operations, the pricing should be selected from ABC USA Operations and not from ABC New York. If there is parent account for ABC USA Operations, then look for applicable parent account pricing.

Solution

There are different price lists, that is, ABC New York, ABC California, and ABC USA Operations with contract number populated on each price list.

- ABC New York Price List contract number is 23456789.
- ABC California Price List contract number is 12345678.
- ABC USA Operations Price List contract number is 01234567.

You must set the parameter **cntrNbr_1** in the correct sequence using the **Configure Products** formula button as follows:

```
IF ( LEN( Apttus_Config2__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_Config2__OrderConfiguration?id=" &Id &"&cntrNbr_1=23456789,12345678" &"&flow=NGDefault", IMAGE("/resource/Apttus_Config2__Button_Configure", "Configure Products"), "_self"), NULL)
```

You can provide multiple contract numbers as comma separated. If the product is found in contract number 23456789, pricing will be applied from ABC USA Operations Price List. If not, look for another contract number 12345678. If pricing is found in contract number 12345678, pricing will be applied from ABC New York Price List. If not, pricing will be applicable from the default price list.

Configuring Contract Pricing through Price Agreements

CPQ can store pricing information when users accept a proposal or some other event occurs, as per client requirement. CPQ can retrieve the same pricing information when the same user creates a proposal for the second time or updates the same price list in case of agreement amendment. Many customers prefer old pricing during renewals or amendments.

When the user creates a quote with Intent = Price Agreement, finalizes the quote, and accepts it, CPQ automatically creates a contract price list with the products from the quote, according to the prices negotiated in the quote. The contract price list is a subset of the standard price list. CPQ assigns a contract number to the new price list generated. The user can then use the contract number and pass it to the future quotes for using the contract pricing feature. The prices in the new quote will be retrieved from contract price list and those prices are the negotiated prices of the original quote.

For more information, refer to "Creating Quote/Proposals from Opportunities" in *CPQ on Salesforce Summer 2020 User Guide*.

Configuring Pricing Profiles and Pricing Batch Size

Pricing profiles and batching price calculations enable you to specify the type of pricing configured so that CPQ can optimize run time price calculations.

The following two custom settings control this behavior:

- **Pricing Profile**
- **Pricing Batch Size**

You can specify the **Pricing Profile** as *Basic* or *Advanced*.

By definition, a pricing profile is *Basic*, if:

- There are no pricing rules used
- There are no price matrices used
- There are no related pricing setup
- There are no bundles

At present, Apttus supports only two pricing profiles: *Basic* and *Advanced*. If the Pricing Profile field is left blank, the default value is *Advanced*. If the Pricing Profile is *Basic* and **Defer Pricing** check box is selected, the performance can be improved by executing price calculations in batches. To enable and control batching of price calculations, use the Pricing Batch Size field.

The Pricing Batch Size setting defines the number of line items that can be processed in a single pricing call. Setting the Pricing Batch Size, the system runs pricing with the specified number of products as a batch, thus increasing performance. These batch calls to the database is governed by Salesforce CPU time limit and hence the number assigned for Pricing Batch Size has to be carefully evaluated.

i These two system properties are global and affect the entire CPQ implementation in an Org. You must ensure that all the products have only Basic pricing configured as defined above.

To set up pricing profile and pricing batch size

1. In **CPQ Console**, go to **Setup > Develop > Custom Settings**.
2. Click **Manage** for **Config System Properties**, and click **Edit**.
3. Select **Defer Pricing**.

i To use **PricingProfile** and **PricingBatchSize**, **DeferPricing** must always be selected.

4. For **Pricing Profile**, type *Basic* or *Advanced*.

i If this field is left blank, the default value is *Advanced*.

5. For **Pricing Batch Size**, type a value.

The screenshot shows two configuration fields. The first field is labeled 'Pricing Batch Size' with a question mark icon and contains the value '5'. The second field is labeled 'Pricing Profile' with a question mark icon and contains the value 'Basic'.

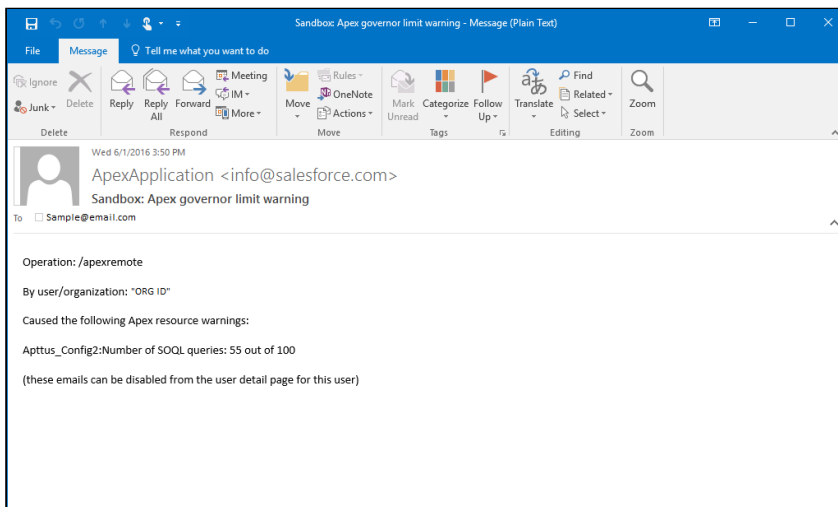

i If this field is left blank, the default value is 1.

6. Click **Save**.

Pricing is performed as defined in Pricing Profiles and batches as defined in Pricing Batch Size.

Configuring Email Notifications for Apex Governor Limit Warning

When Apttus CPQ executes any action (such as pricing or configuration), your users may receive an email notification indicating that they have reached a certain lower threshold for the Apex governor limit. This is a normal behavior and Apttus CPQ is built with these limitations in mind with a certain degree of buffer for further actions. As an Admin, you can disable the email notifications from the user detail page for a specific user.

Managing Cost and Profitability (Cost Breakdown)

Cost of a product, as you see it, is derived from aggregating direct, indirect and variable costs. These costs could be manufacturing, Sales, Administrative, volume-based or any other miscellaneous cost.

For example, the Cost of a Drilling Machine is an amalgamation of costs from various sources incurred during the life cycle of the product - such as raw material, production, labor, time, taxes and other marginal costs. While some of these costs remain stable, some vary depending on the volume, availability or other market conditions.

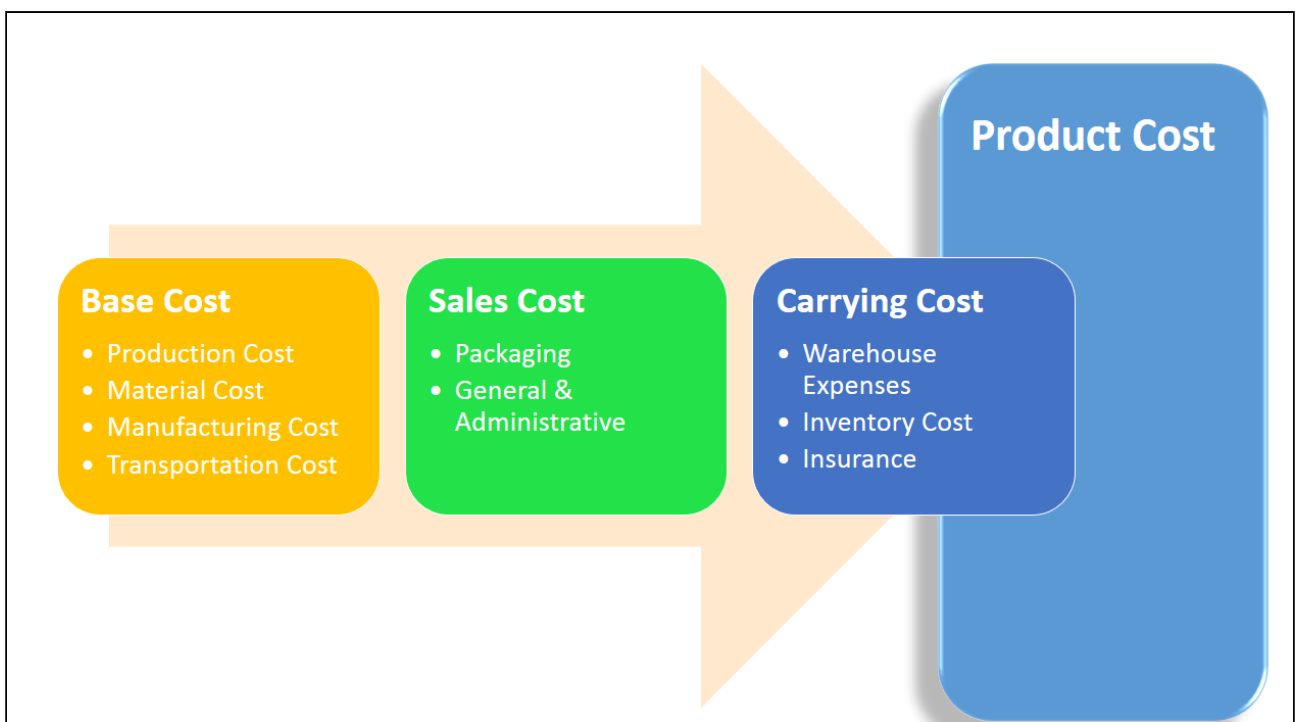

To cite another example, the price of a watch is derived from the summation of the cost of designing, manufacturing, packaging and shipping. Similarly, if your product is a service, cost can be derived from several dependent factors such as infrastructure, security,

fulfillment and others. In a nutshell, for all products, such finer cost elements that are associated with the product life-cycle, together constitute the final cost.

As a Sales Rep, when you are adding products to the cart during the Quote generation process, adding margins and reaching the profitability of the deal will become easy if you can see the cost elements which is precisely the cost break-down of a product.

Visibility of the cost hierarchy for a product that captures every granular cost will empower you to prepare a profitable Quote that leaves no room for generalization and approximation.

When you know the key cost drivers and can see how what other costs contribute to the key cost, you know which costs should be tweaked or modified for arriving at an optimum cost.

The cost models, as you can see in the above illustration, are nothing but the structure of cost elements and sub-elements participating in deriving the final cost. The cost hierarchy gives you the granular level of details regarding the various aspects of product costing. With Apttus CPQ, you can create complex Cost Models that give insights into the true profitability of a product price. During the quotation process, this transparency of costs can provide accurate deal margin decisions that are critical for thriving in the competitive market.

Start implementing the cost model for your products to

- Achieve Effective Deal Guidance,
- Eliminate the need for an external Cost Management application, and
- See the price breakdown and assess the profitability of your quote.

Key Terms

Term	Description
Base Price	The basic product price without break-ups.
Mark-up	Additional cost incurred for a product to create a profit.
Fixed Costs	Costs that do not vary for a long period of time are considered as Fixed Costs. For example, Maintenance Costs, Renting or leasing of assets, Property Insurance etc.
Variable Costs	Costs that are volume-driven or change frequently with time are regarded as being variable. For example, raw materials, labor, social expenses, training etc.

There are three key facets of this feature:

- **Price breakdown**

Earlier you could associate only a single cost to the product. Because the cost is dependent on various factors some of which might vary, a single field defining the cost was very limiting. With cost models in place, you can define the variable and fixed cost elements and achieve dynamic product costing. This approach is the best way to ascertain what a product should be priced at.

To see how you can configure and store the granular costs associated with your product, please refer [Storing the Price of Products](#).

- **Transfer Price**

Setting the price for goods or a product between legal entities within an enterprise is known as Transfer Pricing.

The transfer price is the price at which different goods and services are transferred between divisions within an organization. For example, a division of Motor Company-A, based in South Africa supplies Gears to their global assembly plant in Boston. The division in South Africa will charge the division in South Africa with the cost of the Gear including their profit margin. This price should be an amount that benefits the organization and also allows each department to have a fair share of their profits. Majorly, a Business Unit or Factory "sells" to the front end sales team. There are regulatory requirements around how the transfer price is calculated. OECD (Organization of Economic Cooperation and Development) has set some guidelines and most countries follow or add-on to those guidelines. To know how you can create a Transfer Price mapping, please refer [Transfer Price](#).

• **Price Waterfall**

You can Analyze a Quote by looking at the Price Waterfall chart and Waterfall table for corresponding Line Items and Summary groups. The waterfall chart is a bar graph where Line Item Fields are plotted vertically and Cost is plotted horizontally. For details, please refer Analyze Quote in the user guide.

We'll take a detailed look at each of these aspects in the later sections.

Required Configurations

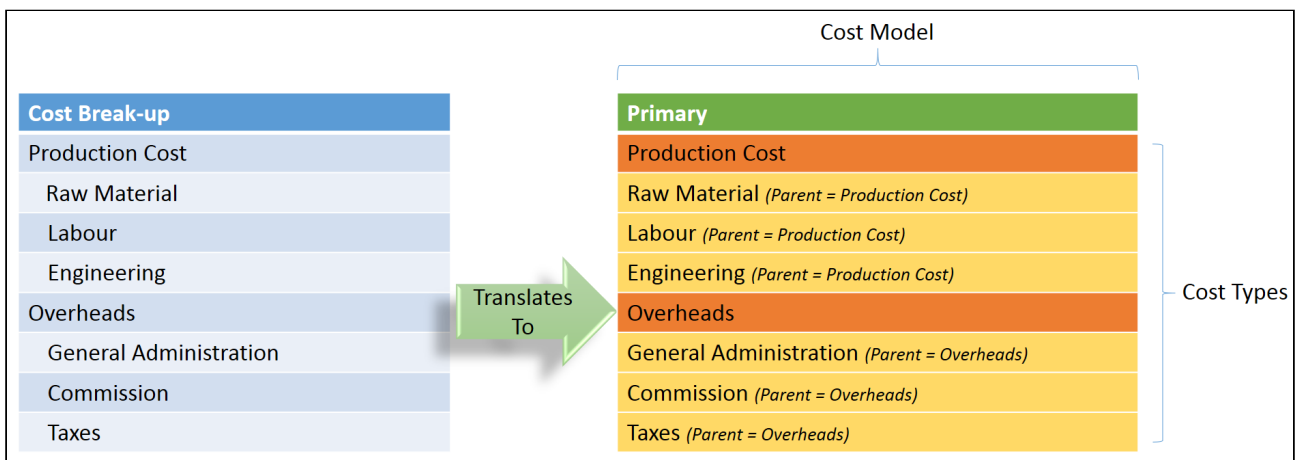

A way to arrive at accurate costing is to dissect the cost into different elements, roll-up this cost and apply markups to finalize it. These elements are identified as Cost Types in the system.

Let us see how you can start creating a cost hierarchy for your products and analyze the margins on the cart. To get started, you need to:

1. **Define a Cost Model.**
 - a. Set a Cost Hierarchy by adding **Cost Types**.
2. **Associate** the Cost Model with a Price List.
3. Configure a Presto App (using X-Author) to store product prices.
4. **Fetch prices** for the Cost Types by adding a Presto Callback.
5. Analyze pricing from **Analyze Quote** button on the cart.

Defining Cost Models

Cost Model is a container holding all Cost Types. As shown in the diagram, you can create n Cost Types for n number of Cost elements.

1. In **CPQ Console**, go to + **(All Tabs)** > select **Cost Models**.
2. Click **New**. The New Cost Model page is displayed.

3. In the **Cost Model** field, enter a name for the cost model.
4. Click **Save**.

Your cost model is created and you can start adding cost types.

Define Cost Types

Cost Types correspond to individual cost entities. You can define *parent* for a Cost Type thereby creating Cost Type hierarchies.

1. From the Cost Types related list, click **New Cost Type**.

The screenshot shows the 'Cost Type Edit' form for 'Transportation Cost'. The form includes the following fields and options:

- Cost Type:** Transportation Cost
- Allow Manual Adjustment:**
- Is Product Specific:**
- Currency:** USD - U.S. Dollar
- Parent Cost Type:** SALES, GENERAL AND AD
- Label:** Transportation Cost
- Cost Model:** GBP Price List
- Sequence:** 10
- Cost ID:** CB-0000000350
- Ext Id:**
- Is Pricing:**
- Level:** 3

Buttons at the top and bottom include 'Save', 'Save & New', and 'Cancel'. A 'Required Information' indicator is visible on the right side of the form.

2. Enter the following details and click **Save**:

Field	Description
Cost Type	The name for a Cost Type.
Label	A Label differentiating the Cost Type.
Sequence	The order for arranging hierarchies sequentially.
Parent Cost Type	Choose a Parent Cost Type for the said Cost Type.
Cost Model	Read-only field that indicates the Cost Model associated to this Cost Type.
Allow Manual Adjustment	If selected, allows you to override costs on the Analyze Quote page. On clicking Reprice, the base price is recalculated with the new costs.
Currency	The Currency specific to this Cost Type.
Hide Child Cost Types in Price Waterfall	If selected, allows you to hide a cost category and its children from being displayed on the Analyze Quote page.

Associating Cost Models with a Price List

You can associate one cost model with multiple price lists. However, one price list can have only a single cost model associated with it.

To associate a cost model with a price list

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Lists**.
3. Select the required price list
4. In the **Cost Model** field, search and select a cost model of your choice.
5. Click **Save**.

Configuring the Analyze Quote Page

Click **Analyze Quote** button on the cart, to load the **Analyze Quote** page.

Analyze Quote page is divided into following four components:

1. Product and Summary Sidebar
2. Line Item Key Metrics
3. Line Item Waterfall Chart

4. Waterfall Table

You can opt to display the fields of your choice in the **Line Item Key Metrics** and **Line Item Waterfall Chart** screen elements for both **Line Items** and **Summary Group** options.

Go to **Config Settings > Display Column Settings** and select **Display Type** as *Line Item Key Metrics* for configuring fields displayed on top of the page.

Similarly, you can configure the display for *Line Item Waterfall*, *Summary Group Key Metrics*, *Summary Group Waterfall* and *Optional Cost and Profitability Fields*.

All the fields of Cost Line Item, Adjustment Line Item, and Cost Adjustments are available to be displayed on the Analyze Quote page.

Storing the Price of Products

The Price for each Cost Type is defined in an Excel App. You have to replicate the Cost Model, defining various Cost Types and their pricing with the help of X-Author Designer. When you click Configure button on the Quote/Proposal, pricing data from this app is fetched and shown for analysis.

To get started, you will need to Install **X-Author** and **Designer** and **Runtime** packages.

App Setup

Install the following packages:

- X-Author for Excel (3.25 or higher)

- Apttus X-Author™ For Excel Document Generation (1.0)
- Apttus Document Generation (1.5)
- X-Author Designer for Excel

Getting Started

1. In your Salesforce org, create a **Cost Model** and add Cost Types.
2. Open X-Author Designer and create a pricing app.
3. For information on how to create an app, please refer to **Creating Apps with Quick Apps** section in *X-Author for Excel Designer and Runtime Guide*.
4. Ensure the Cost Type Label and Cost ID matches with the Cost Names specified in the org.
5. On the App, add Parent Code (from the Salesforce URL) for the child Cost Items.
6. **Validate** and **Save** the App.
Go to your Salesforce org and access Apps tab to see your app.
7. Edit the app and select **Activated** to activate it.
8. Create a **Price List** and associate it with the Cost Model.
9. In order to run this App while configuring products, pass the App Id in the 'prestoAppId' field in the following formula.

```
"IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0, HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=" &Id
+"&flow=NGDefault"&"&useAdvancedApproval=true&useDealOptimizer=true"&
"&prestoAppId=a5t2C0000000GnBe",
IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_se
lf"), NULL)"
```

10. Go to + **(All Tabs)** > **Apps**, open your app and copy the App Id from the URL.
11. Create a Quote, add the product to the cart and click Reprice. To see the price breakdown Click **Analyze Quote** button.

Configuring Transfer Pricing

Transfer Pricing is the price at which two related parties perform business transactions between themselves. Every organization follows a regulatory guideline specific to their country to derive transfer prices for the products. This formula states one of the ways in which Transfer Pricing is calculated.

Transfer Pricing = Full Cost (sum of all fixed and variable costs) + **Markups**

- Let's assume the Sales Rep exposes a currency field 'Manufacturing Cost' and sends collaboration request to another Factory user.

Cost Model available with the Sales Rep

Cost Name	Value
Packaging	\$100
Transportation	\$50
Manufacturing	-

Cost Model with the Factory User

Cost Name	Value
Manufacturing	\$70 (Cost of Raw Material + Labor)
Raw Material	\$30
Labor	\$40

The administrator needs to create a [Transfer Map](#) so that Sales Reps can send out a collaboration request. For this requirement, the Transfer Price Map would look as the following:

Field	Value
Source Field	Apttus_Config2__Manufacturing__c
Source Charge Type	Standard Price
Target Cost Model	Factory Cost Model
Target Field	Requested_ManufacturingNetPrice__c
Target Object	Apttus_Config2__LineItem__c

Configuration

- In **CPQ Console**, go to + **(All Tabs)** > select **Cost Models**.
- Select the required cost model.
- From the Transfer Prices related list, click **New Transfer Price** to create a Transfer Price mapping.
- Enter the following details and click **Save**.

Field	Description
Source Field	The <i>API Name</i> of the field for which you want the pricing details.
Source Charge Type	Mention the Charge Type of the Source Field, whether it is a Standard Price, License Fee, Subscription Fee or any other.
Target Cost Model	Enter the name of the destination Cost Model from which you want to get the price of a field.
Target Field	Enter the <i>API Name</i> of the field as given in the Target Cost Model.
Target Object	Enter the <i>API Name</i> of the Target Object which the Target Field is a part of. For example, if the Target Field is 'Net Unit Price' and is defined on the Line Item object, the Target Object will be <code>Apttus_Config__LineItem__c</code> .

Procedure

1. Create a new Quote using price list.
2. Click Configure Products button. Add products and go to Cart.
3. Using the collaborator icon send the request to Factory User.
4. Factory User receives the Collaboration Request. Applies adjustments or enters the price and clicks **Submit For Merge**. Please refer Assigning the configuration to the Collaborator or Queue for details.
5. The Transfer price is set to copy **Net Price** from Collaborator's Quote to a cost type named "Cost From Factory" of requester's Quote.
6. Open the requester's Quote. Go to Cart and click **Merge** in the Collaborator pop-up.
7. Click **Analyze Quote** to analyze the product cost.

Configuring Unit of Measure (UOM) and Frequency Conversion Rate

Unit of measure (UOM) is a way to quantify resources. It is a key factor in pricing and discounting the products on the cart. With the new object called **Frequency/UOM conversion rate**, you can define a set of unit of measures for your product families. Products under the same family can be priced differently, based on its unit of measure. Depending on

the available unit of measures for the product family, the sales reps can define different discounts for different UOMs for the same product.

The current design requires all products under the same product family to share the same UOM conversion rates. So an implementation tip is to use product category to group products by business needs, but use product family to group products that share the same conversion rates. For example, different types of coffee can be grouped under a single category called Coffee, but if you want to apply the same conversion rate to dark roast and mild roast coffee products, you can create a new product family called Roast Coffee.

Frequency/UOM conversion rate is a new object, along with fields such as **Conversion Factor** and **Type**. Depending on the type of conversion type, you must define the field values for either the Frequency conversion or UOM conversion. You can also control whether to apply these conversions on a product family and product category.

You can only define UOMs and UOM conversion rates for product families; one product can exist in multiple categories, but only in one product family.

Use case: Creating UOM and conversion rate for products

Description: This use case describes how to create frequency conversion rates and unit of measurements for pricing the products on the cart. You might use this functionality differently, depending on your business case.

Suppose you are a coffee vendor and want to sell your product by considering the customer requirements in terms of kilograms and boxes. As a system administrator, you can set up the type of measurement as kilogram and box, and define the conversion rate for these measurements.

In the following example, the sales administrator creates a conversion type for the coffee product.

Action	Conversion Rate Id	Type	Product Category	From Frequency	To Frequency	From Uom	To Uom	Conversion Factor
Edit Del	CR-000000000000	Unit Of Measure	Coffee	Each	Each	Each	Box	10.00000000000000
Edit Del	CR-000000000001	Unit Of Measure	Coffee	Each	Each	Each	Kilogram	20.00000000000000
Edit Del	CR-000000000002	Unit Of Measure	Coffee	Each	Each	Each	Case	5.00000000000000
Edit Del	CR-000000000003	Unit Of Measure	Coffee	Each	Each	Box	Kilogram	2.00000000000000

The above setup represents the following UOM conversion rates for the product family Coffee

1 Box = 10 Each

1 Kilogram = 20 Each

1 Case = 5 Each

1 Kilogram = 2 Box

Pricing admin can create product list for any products under the product family Coffee and use above UOMs captured in the UOM conversion table.

For example, the pricing admin can create prices list in the following UOMs:

Table 1

Product	Price	UOM
Dark Roast	\$10	Each
Dark Roast	\$95	Box
Dark Roast	\$50	Case
Medium Roast	\$10	Each
Medium Roast	\$90	Box
Medium Roast	\$45	Case

And the sales rep can create the following manual adjustments on the cart:

Table 2

Product	Discount	UOM
Dark Roast	\$2 off	Each
Dark Roast	\$23 off	Box
Dark Roast	\$12 off	Case
Medium Roast	5% off	Each
Medium Roast	8% off	Box
Medium Roast	5% off	Case

In the cart, the pricing engine converts the quantities from the Pricing UOM to the Selling UOM and the discounting UOM to the Selling UOM.

To create a Frequency Conversion Rate

Perform the following steps to create a new record of frequency conversion rate:

1. In **CPQ Console**, click  (All Tabs) and search for **Frequency/UOM Conversion Rates**.
2. Click **Frequency/UOM Conversion Rate** tab and click **New** to create a new record.

3. The record is divided into 4 sections and the fields in each section are explained below:

Information	
Field	Description
Type	Defines the currency metric type. Available values are <i>Frequency</i> and <i>Unit Of Measure</i> . Depending on your selection, you must enter the values in either Frequency or UOM Conversion table.
Product Family	Defines the Product family to which you want to apply the conversion rate. This helps you filter the group of products on which you want to apply the conversion rate. Ensure that you have created a product family record so as to see it populated in this picklist.
Product Category	Defines the Product category to which you want to apply the conversion rate. This helps you filter the group of products on which you want to apply the conversion rate. Ensure that you have created a product category record so as to see it populated in this picklist. In our example, the product category is <i>Coffee</i> .
Frequency Conversion > applicable for Type = <i>Frequency</i>	
Field	Description
From Frequency	Defines the starting frequency for a conversion rate from which the rates are valid.
To Frequency	Defines the ending frequency for a conversion rate until which the rates are valid.
UOM Conversion > applicable for Type = <i>Unit of Measure</i>	
Field	Description
From UOM	Defines a unit of measure that can be used as a source for rate conversion. For example, if you want to measure a coffee box in terms of Box to Kilogram conversion, use <i>Box</i> in From UOM and <i>Kilogram</i> in To UOM field.
To UOM	Defines a unit of measure that can be used as a destination for rate conversion.

Rate	
Field	Description
Conversion Rate	Defines the rate at which you want to convert the product. In our example, for UOM conversion from Box to Kilogram for 1 box = 2 kilograms, enter 2 in this field.

4. Click **Save**.

You must create these records for each UOM that you want to configure. In our example, you must create one record for each row of Table 1.

Configuring the Currency Rounding

This section provides information on configuring currency rounding in pricing calculations. This feature rounds adjustments before calculating the base price.

Prerequisites

Enable Custom Rounding must be True. For more information, see *Config System Properties* in [Configuring Custom Settings](#).

To configure currency rounding

Perform the following steps to configure currency rounding.

1. In **CPQ Console**, go to **Setup > Develop > Custom Settings > Config System Properties > Manage**.
2. Click **Edit** next to **System Properties**.
3. In the **Rounding Mode** field, enter one of the following values.

Value	Description
UP	Rounds the currency to the next number. For example, 21.2 is rounded to 22.
DOWN	Rounds the currency to the previous number. For example, 21.8 is rounded to 21.
HALF_UP	Rounds the currency to the next number if the decimal is equal to or greater than 5. For example, 21.5 to 21.9 is rounded to 22.

Value	Description
HALF_DOWN	Rounds the currency to the previous number if the decimal is equal to or smaller than 5. For example, 21.1 to 21.5 is rounded to 22.
HALF_EVEN	Rounds the currency to the nearest even number. For example, 23.5 is rounded to 24 and 22.5 is rounded to 22.

4. Click **Save**.

Managing Currency Conversion

You can set the exchange rate between the currency of your organization and another currency for a certain period.

 If the Sales Representative uses the conversion rate on a date that is not within the defined period for currency exchange rate, CPQ displays an error message on the Cart.

Prerequisites

You must set the value of the `useAdvancedCurrency` parameter to `True` to enable dated currency conversion.

To manage currency conversion

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Currency Conversion**. The Dated Currency Exchange Rates page with a list of existing exchange rates is displayed.
3. Click **Add New Conversion**. A new item is added at the end of the list.
4. Enter the following details:

 If the exchange rate is already available between the same currencies and you enter the exchange rates between the same currencies for the same period, CPQ displays an error message.

Field	Description
Currency From	CPQ selects the source currency automatically based on the currency you have configured for your organization.
Currency To	Select the target currency to which you want to convert the source currency.
Exchange Rate	Enter the exchange rate between two currencies.
Rate Type	Select the rate type for currency conversion. Currently, Period End Date is supported.
Start Date	Select the start date from when the currency conversion must be effective.
End Date	CPQ enters the End Date automatically after you provide the Start Date for the next entry for the exchange rate between the same currencies. For example, you provided the first rate between USD and EURO from 01/01/2020. Now when you provide the rate between the same currencies from 01/04/2020, the End Date for the previous entry is taken automatically by as 31/03/2020.

5. Click **Save**.
6. Click the more icon (⋮) and select **+ Add** to add a new conversion or select **X Remove** to delete an existing conversion.

Managing Quotes or Proposals

In this section,

Enabling Quote Collaboration in the Org

Quote collaboration feature empowers your sales reps to work together on the same quote. A sales rep starts the configuration process, and assigns configuration request to other sales rep (called collaborator) where he needs help. The sales rep can assign multiple line items to a collaborator. A sales rep can also assign different line items to different collaborators.

The Quote Collaboration feature is useful for a large industrial equipment manufacturer, which has a complex quoting needs. The people who understand the products are located in different factories around the world. When a client requests a quote from a sales rep, the sales rep has to contact different factories and get configuration information. The problem is that the sales rep does not always know who is the right person for the job and does not have all the necessary support and collaboration. This burdens the quoting process by:

- Slowing it down.
- Making it more complex and expensive.
- Making it less accurate.

In such a scenario, quote collaboration enables the sales rep to collaborate while working on a single quote by assigning configuration tasks to different people and orchestrating that process. Then, the sales rep can merge the collaboration data to generate one final quote and send it to the customer.

For detailed flow and use case around Quote Collaboration, refer to Quote Collaboration in the User Guide.

To enable Quote Collaboration in your org

1. Add the **Collaboration** column by navigating to **All Tabs > Config Settings > Display Columns settings**. Choose the **Display Type** as *Cart Line Item* and **Flow** as *ngFlow*. Apart from the desired flow (e.g. ngFlow), the **Collaboration** column must be added to the settings for *Default* flow as well.

2. Specify the following collaborator fields API names in the **Setup > Develop > Custom Settings > Config System Properties > Manage > System Properties > View Cart Custom Fields**.
 - Apttus_Config2__CollaborationRequestId__c
 - Apttus_Config2__CollaborationRequestId__r.Apttus_Config2__Status__c
 - Apttus_Config2__CollaborationRequestId__r.Owner.Name
3. Navigate to **CPQ Console > Maintenance Console > Query Field Metadata** and click **Refresh Field Metadata**.
4. Create Lookup Field Settings for User and Queue assignment. Also, for Queue assignment, ensure that you have listed *Product Configuration* and *Collaboration Request* in the **Supported Objects** list.
5. Ensure that the Salesforce queue which needs to participate in the collaboration process supports **Product Configuration** and **Collaboration Request** objects. This is required to assign a collaboration request to the queue.

- Ensure that you assign appropriate field level permissions for Collaboration Request object and Line Item object.
- If the collaboration icon is not displayed on the Cart, ensure that **Collaboration** field's **Is Editable** property is set to *False* under Display Column Settings > Cart Line Item.

To define Permissions to use Quote Collaboration Feature

The administrator must define proper access permissions for user profiles to use Quote Collaboration. Otherwise, the user cannot see the collaboration feature on the Cart page. Follow the steps below to define access permissions for the user.

1. Go to **Setup > Administrator Setup > Manage Users > Profiles**.
2. Find the profile for which you want to set permissions and click **Edit**.
3. Find **Collaboration Request** under the section **Custom Object Permissions**.
4. Select one or more permission from the list below to define access for the profiles.

Name	Impact on the Cart Page
Read	A disabled collaboration icon is displayed on the Cart page.
Create	The collaboration icon is enabled. The actions fields in the collaboration pop-ups are enabled and the user can assign a line item to a collaborator.

Name	Impact on the Cart Page
Edit	The Update and Merge actions are enabled on collaboration pop-up and the user can edit a configuration assigned to them.
Delete	Cancel action is enabled on the collaboration pop-up.
Modify All	The Read , Delete , and Edit permissions are selected automatically. The Update , Merge , and Cancel actions are enabled on the collaboration pop-up.

Actions performed on the collaboration request with the **Modify All** permission have a different impact on the collaboration status as opposed to when the **Modify All** permission is not selected. If **Modify All** is selected, when the user abandons the cart, cancels the collaboration request, or deletes the line item, the collaboration record is deleted. Otherwise, the collaboration status changes. If you do not select any permission, the collaboration icon remains disabled on the Cart page.

For more information on collaboration status, refer to **Quote Lifecycle Collaboration** in *CPQ on Salesforce User Guide*.

5. Click **Save**.

To enable Chatter on Collaboration Request

A chatter feed is enabled on each collaboration pop up. The feed is in the context of a single collaboration request and it can be accessed through a new tab on the collaboration pop up.

Ensure that you configure the following steps:

1. Go to **Setup > Build > Customize > Chatter > Feed Tracking**.
2. In the Object section, search for *Collaboration Request*.
3. In the Fields section, select **Enable Feed Tracking**.
4. Click **Save**.

Ensure that you have Quick actions such as Post, File, Link, and Poll on the Chatter Layout. You can verify these actions from **Setup > Build > Chatter > Publisher Layouts**.

To define field set settings

You must define **Collab Create Fields** and **Collab Merge Fields** in Field Set Settings. As described in the topic [Configuring Field Set Settings](#).

To setup the Email Templates for Quote Collaboration

In order to send emails to the Sales rep and Collaborator for different actions involved in Quote Collaboration Lifecycle, you must setup the following email templates in your org.

Template Name	Description
Collaboration Task Assigned	When sales rep assigns the configuration to a collaborator, collaborator receives an email. The content of the email is controlled from Collaboration Task Assigned template.
Collaboration Task Completed	When collaborator submits his configuration, sales rep receives an email. The content of the email is controlled from Collaboration Task Completed template.
Collaboration Task Merged	When Sales rep accepts and merges the configuration submitted by the collaborator, collaborator receives an email. The content of the email is controlled from Collaboration Task Merged template.
Collaboration Task Updated	After assigning a configuration to the collaborator, when sales rep updates such configuration request, the collaborator receives an updated email. The content of the email is controlled from Collaboration Task Updated template.
Collaboration Request Cancelled	When sales rep updates the configuration request owner and re-submits the same configuration to someone else, the previous collaborator receives a cancellation notification email. The content of the email is controlled from Collaboration Request Cancelled template.

To setup the email templates, navigate to **Setup > Communication Templates > Email Templates** and create separate records for the above-mentioned templates.

Once you have created the above-mentioned templates, you need to create workflow rules for **Collaboration Request** object from **Setup > Build > Create > Workflow & Approvals > Workflow Rules**, which uses the appropriate template to send out the email notification.

Workflow Rule Name	Object	Evaluation Criteria	Rule Criteria
QuoteCollabNotifyOnCreate	Collaboration Request	Evaluate the rule when a record is created, and every time it's edited	<pre>OR (AND (ISCHANGED(Apptus_Config2__Status__c), ISPICKVAL(Apptus_Config2__Status__c, 'Submitted')), AND (ISCHANGED(OwnerId), ISPICKVAL(Apptus_Config2__Status__c, 'Submitted')))</pre>
QuoteCollabNotifyOnUpdate	Collaboration Request	Evaluate the rule when a record is created, and every time it's edited	<pre>AND (NOT(ISCHANGED(OwnerId)), NOT(ISBLANK(Apptus_Config2__ChildConfigurationId__c)), NOT(ISCHANGED(Apptus_Config2__ChildConfigurationId__c)), ISPICKVAL(Apptus_Config2__Status__c, 'Submitted'), ISCHANGED(LastModifiedDate))</pre>
QuoteCollabNotifyOnComplete	Collaboration Request	Evaluate the rule when a record is created, and every time it's edited	<pre>AND (ISCHANGED(Apptus_Config2__Status__c), ISPICKVAL(Apptus_Config2__Status__c, 'Completed'))</pre>
QuoteCollabNotifyOnAccept	Collaboration Request	Evaluate the rule when a record is created, and every time it's edited	<pre>AND (ISCHANGED(Apptus_Config2__Status__c), ISPICKVAL(Apptus_Config2__Status__c, 'Accepted'))</pre>

Workflow Rule Name	Object	Evaluation Criteria	Rule Criteria
QuoteCollabCancelNotificationOnChangeOfOwner	Collaboration Request	Evaluate the rule when a record is created, and every time it's edited	<pre>AND (ISCHANGED(OwnerId), ISCHANGED(LastModifiedDate), ISPICKVAL(PRIORVALUE(Apttus_Config2__Status__c), 'Submitted'))</pre>
QuoteCollabNotifyOnUpdateAfterCompletion	Collaboration Request	Evaluate the rule when a record is created, and every time it's edited	<pre>AND (NOT(ISCHANGED(OwnerId)), AND(ISCHANGED(Apttus_Config2__Status__c), ISPICKVAL(Apttus_Config2__Status__c , "Submitted"), OR(ISPICKVAL(PRIORVALUE(Apttus_Config2__Status__c), "Completed"), ISPICKVAL(PRIORVALUE(Apttus_Config2__Status__c), "Accepted"))), ISCHANGED(LastModifiedDate))</pre>

For the corresponding Workflow Rules, create the appropriate email alert action (email template, and the recipient) from the **Workflow Actions** section.

Configuring the Collaboration Dialog Box

You can specify the fields to be displayed on the Collaboration Pop Up dialog box.

This configuration enhancement allows you to configure your own set of relevant fields on the assignment pop-up in order to capture adequate information before the request is sent or assigned to the collaborator to work on.

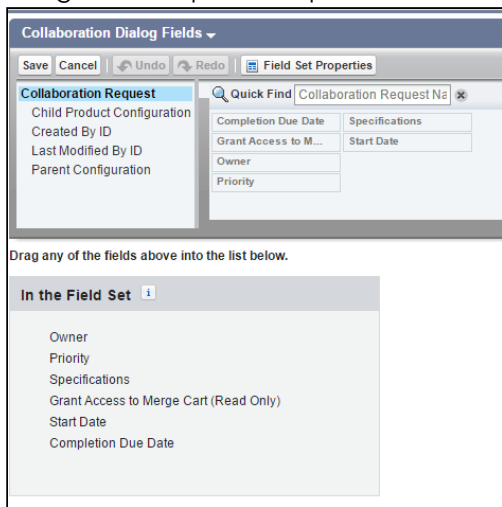

To configure the collaboration pop up Assignment Details:

1. Navigate to **Setup > Create > Objects > Collaboration Request**. This custom object persists the information for quote collaboration tasks and it is used to relate the parent configurations and its related child configurations.

2. Click **Edit** for **Collaboration Dialog Fields** Field Sets. You can control the fields that are displayed on the Quote Collaboration pop up **Assignment Details** tab.

3. Drag and drop the required fields in the **In the Field Set**.

4. Click **Save**.

You can configure the fields that you see on **Assigned Products** and **Completed Configuration** tabs from **Config Settings > Display Column Settings > Collaboration Parent Line Item** and **Config Settings > Display Column Settings > Collaboration Child Line Item** respectively. These two tabs are enabled after you have initiated the collaboration request with the collaborator.

Assigned Products tab shows the information of the collaboration request details as assigned by the sales rep. Completed Configuration tab shows the information of the collaboration request details as submitted by the collaborator. When you navigate to **Completed Configuration** tab, and click **More details**, you can see the submitted configuration in a read-only mode.

Configuring the Default User or Queue Setup

By configuring default user or queue to be displayed on the collaboration popup dialog box, you can achieve a robust as well as accurate collaboration process, as the request

assignment becomes faster and intuitive. The purpose of this feature is to enable enterprise organizations having a plethora of users and queues to filter and default their queues based on the product group, product family, account location and so on. In order for this feature to fulfill its goals and function properly, the right setup has to take place and link the desired user or queue to the filtering logic you want to use.

Ensure that following setup is configured successfully.

1. Set up a user or queue.
2. Set up Location on the quote: This quote location should carry over to the line items on the configuration. you can setup location or any other parameter. make sure that the line items have the location, if you want to filter based on the location.

Note

The field that you wish to base your filtering on, ensure that it is defined (whether it is a product family, product group, account location).

3. Set up Junction object - lookup junction
 - Include all fields that should be referred to. For example Queue ID (you can grab the ID from the URL), account location, product, product family, users, and so on.
 - You need to set this up for each user or queue separately.
 - After this setup, your user or queue is now tied to a location or a product. In order to expose this newly formed link, you need to configure the lookup filter.

Lookup Junction Detail		Edit	Delete	Clone
Lookup Junction Name	San Diego 2 - Intern Queue			
Account	San Diego 2			
Product Family				
Is Default	<input checked="" type="checkbox"/>			
User				
Queue	00G0B000003M5eh			
Product				
Account Location	San Diego 2			
Created By				
		Edit	Delete	Clone

Note

Default flag determines if this user or queue is default or not. Specify rest of the fields, you wish to link to your user or queue.

4. Set up **Lookup field settings**. This filter uses the information from the line item and matches it to the lookup junction object information. For example, if the line item's location is France, then all the queues that are defined with a junction object as located in France appears in the collaboration popup dialog box. You can default one of the French queues. In case if there are multiple queues are defaulted, the system only chooses the first one that gets defaulted. Other French queues which do

not default are also displayed in the queue drop down and the sales rep can change the selection. Note that the default queue will be pre-selected.

Field	Description
Object Name	Specify the object name from which the lookup relationship is created.
Lookup Field Name	Specify the field name that shows the filtered results.
Display Columns	Specify the API names of fields to be displayed on the lookup dialog box, separated by a comma.
Filter Criteria	Specify the valid expression to further filter down the search results for a lookup.
Default Flag Field	Specify the API name of the specific default flag field on the junction object that stores the information whether the user or queue is default or not.
Source Field	Specify the API name of the field that contains the ID of the field that you are trying to lookup and display on the collaboration popup dialog box.
Source Object	Specify the junction object API name.

Name	CollaborationRequest__c.User.OwnerId	Object Name	CollaborationRequest__c
Lookup Field Name	OwnerId.User	Display Columns	Name
Filter Criteria	LocationId__c = Lineltem__c.LocationId__c	Default Flag Field	
Source Field	UserId__c	Source Object	Junction__c

Configuring Real-Time Cart Notifications

Sales rep sees a notification popup on the top right side of the screen when collaboration request is submitted, completed, accepted and merged in the parent cart.

To enable this enhancement, after you upgrade to the November 2016 release, you must enter the following piece of code in the Developer Console/Workbench:

```
Apttus_Config2.NotificationFeedService.createPushTopic();
```

 You need to execute the above code only once and it will apply on all subsequent upgrades, unless you manually delete the PushTopic.

Enabling Cart Locking for Concurrent Access

Cart locking helps prevent data loss while a sales rep is working on a configuration. When a sales rep is working on a configuration (in edit mode), any other user who tries to access the cart at the same time will get redirected to a read-only view of the cart. The user in read-only mode can gain edit access only after the sales rep saves or finalizes or abandons or closes the cart.

A new custom setting, **Enable Cart Locking for Concurrent Access** has been introduced to handle the cart locking functionality. Available under **Setup > App Setup > Develop > Custom Settings > Config System Properties > Manage**, this custom setting enables your cart for concurrent access to other sales representatives.

A new field named **Current User** is added in the Product Configuration object which contains the ID of the user accessing the cart in the edit mode.

Enabling PDF Security for Generated Proposal Documents

When you generate a quote in a pdf format, you can Enable PDF Security for the generated proposal document by following the configuration steps below:

To enable pdf security on the generated Quote/ Proposal document

- You must set up *Proposal System Properties* for this feature. Go to **Setup > Develop > Custom Settings**. Click **Manage** next to *Proposal System Properties* list, then click **Edit** next to *System Properties* and do the following:
 - a. Select the **Enable PDF Security** check box.
 - b. Enter a desired value in the **PDF Owner Password**.
Refer Custom Settings > [Proposal System Properties](#) for detailed information.
1. Click  and click **Admin**.
 2. Do any one of the following:

- Click **New** to create a new Admin entry.
 - Click **Edit** for an existing admin property *APTS_ProposalConfig*.
3. In the **Name** field, type *APTS_ProposalConfig* and in the **Value** field, type *XML*.
 4. In the **Code** field, type the following code:

```
<ProposalConfig>
<PDFSecurityDefault>
<CanPrint>true</CanPrint>
<CanCopy>true</CanCopy>
<CanChange>false</CanChange>
<CanAddNotes>true</CanAddNotes>
<CanFillFields>true</CanFillFields>
<CanAssemble>false</CanAssemble>
</PDFSecurityDefault>
</ProposalConfig>
```

5. All the tags defined over here are available in the *ProposalConfigSchema* static resource. To view this static resource, you may navigate to **Setup > Develop > Installed Packages > Apttus Proposal Management (Managed) > View Components > ProposalConfigSchema > View file**.
6. Click **Save**.

The proposal document generated in PDF format will now be secured with the system password.

Configuring Quick Quote Mode

You can use Quick Quote mode to quickly select numerous products from the product selection page directly from an opportunity with just one click.

Quick Quote has enhanced search capabilities that include targeting standard and custom fields, advanced search, automatic pre-filters, saved list views, and can be sorted. When you have a long list of individual products, you can use the Select All function to select all individual products together.

 Only auto-inclusion constraint rules can be used with Quick Quote. Other constraint rules will be ignored.

To create quick quote custom button

1. Go to **Setup > App Setup > Customize > Opportunities > Buttons, Links, and Actions** and click **New Button** or Link.
2. Type a mandatory Label and a mandatory **Name** for the button. For example: Label = *Create Quick Quote* and Name = *CreateQuickQuote*.
3. Type a **Description** and from **Display Type**, select **Detail Page Button**.
4. Select a mandatory **Behavior** and a mandatory **Content Source**.
5. In the **Code Snippet**, type the following:

```
/apex/Apttus_QPConfig__OpptyQuoteCreate?id={!Opportunity.Id}
&recordTypeName=Proposal&priceListId={!Opportunity.PriceListId__c}
&method=quickAdd&useAdvancedApproval=true&defaultQuantity=1&defaultSellingTerm=
1
```

6. Click **Save**.

The Quick Quote custom button is created.

Add the Quick Quote custom button to the layout.

To add the quick quote button

You must have already created a Quick Quote custom button.

1. Click **Page Layouts** and click **Edit** for the page layout to which you want to add the **Create Quick Quote** button.
2. From **Buttons** in the Layout configuration window, select **Create Quick Quote** and drag and drop it onto the page layout.
3. Click **Save** in the Layout configuration window.

Create Quick Quote button is added and saved onto the page layout.

Click the Create Quick Quote button to select numerous products and proceed to create a quote.

Customizing Visualforce Pages

You can configure which standard columns and actions are available in the catalog, attribute, bundle, and shopping cart pages, the style they use, and the order in which they are displayed. Additionally, you can create your own custom fields and actions and display them in these Visualforce pages.

The Visualforce pages are used for product selection, select attributes, options, and in the cart page change quantities, apply discounts, and more for your quote/proposal. If there are default fields and actions that are not required, or new fields you want to add, you can make those changes through the CPQ *Config Settings* tab.

- [Configuring Display Columns Settings](#)
The Display Column Settings enable you to display only those key fields needed to quickly and easily configure your quote/proposal.
- [Configuring Display Actions Settings](#)
The *Display Action Settings* page provides a simple interface for selecting actions, applying styles, and reordering them. You can even create and use your own custom action.
- [Configuring Custom Actions for Auto-Synch of Cart Lines](#)
The Custom Actions feature has been enhanced to auto-synch cart lines with proposal lines and navigate to other pages.

Configuring Display Columns Settings

The Display Column Settings enable you to display only those key fields needed to quickly and easily configure your quote/proposal.

The *Display Column Settings* page provides a simple interface for selecting fields, making fields editable, applying styles, and reordering them.

To display different number type values as expected, you can add one of the following styles to cart line item fields:

aptCurrency	This will prepend the appropriate currency symbol for the org's locale and retain two digits after the decimal place for the field value. You can change the number of digits using the Currency Field Precision in Config System Properties.
aptPercentage	This will retain two digits after the decimal place (if present) and append the percentage symbol to the field value. You can change the number of digits using the Percentage Field Precision in Config System Properties.
aptQuantity	This will retain two digits after the decimal place (if present). You can change the number of digits using the Quantity Field Precision in Config System Properties.

The following style classes have to be applied in pair to the dynamically selected adjustment column and its value column. i.e., Adjustment Type and Adjustment Amount columns.

- aptAdjustmentType
- aptAdjustment

The formatting for the **Adjustment Amount** field will change dynamically based on the **Adjustment Type**. This is achieved by applying available style classes to the adjustment based on the value in the pick list of the adjustment type.

Note: For changes to the shopping cart beyond those described here, you would need to create custom pages of the Shopping Cart (*CartView* and *CartFinalize* Visualforce pages) and write your own Apex code to further control what fields are displayed and how the page is organized.

 In order to use PULL promotions on the Cart, you must follow the procedure mentioned below with **Display Type = Apply Promotions**.

To customize a display column

1. Click  (All tabs) and click **Config Settings**.
2. Click **Display Column Settings**.
3. To create or modify columns on one or more of the following, select the view from the **Display Type** picklist.
 - Cart Line Item
 - Cost Line Item
 - Cart Total Item
 - Installed Product
 - Related Purchases
 - Agreement Price Rule
 - Agreement Price Tier
 - Adjustment Line Item
 - Usage Price Tiers
 - Apply Promotions
 - Option Line Items
 - Price Ramp
 - Tiered Price
 - Related Price
 - Mass Update
 - Mass Edit (Assets)

 Mass Edit (Assets) is an invalid selection for Display Type.

- Collaboration Parent Line Item
- Collaboration Child Line Item
- Line Item Key Metrics
- Line Item Waterfall
- Summary Group Key Metrics
- Summary Group Waterfall
- Optional Cost and Profitability Fields
- Cart Summary
- Asset Termination

 If you add only the **Termination Date** field, CPQ displays:

- The Confirm Swap pop-up with the **Effective Date** field instead of the Confirm Installed Products Swap page during asset swap.
- The Confirm Termination pop-up with the **Termination Date** field instead of the Confirm Termination page during asset termination.

When the Apttus Billing Management package is not installed in your org, it is recommended to display the Confirm Swap or Confirm Termination pop-up. Otherwise, all billing fields will be blank on the Confirm Installed Products Swap or Confirm Termination page.

4. Select your desired flow from the **Flow** picklist.
5. The **Sequence** column is system-generated and based on your **Display Type** selection in Step 3, the **Display Type** column displays the line item name.
6. In the **Field Name** column, select a field you want to display as a column.

- ⓘ You should not add *Option* as a column as Product and Option columns are identical in the CartDetailView page. The supported values are:
- Termination Date
 - Start Date
 - End Date
 - Original Start Date
 - Net Price
 - Billed Through Date
 - Total Billing
 - Invoiced
 - Pending Billing
 - Estimated Credit
 - Asset TCV
 - Current Contract Start Date
 - Current Contract Value
 - Current Contract Billing (Invoiced)
 - Current Asset Billing (Invoiced)
 - Current Contract Pending Billing
 - Current Asset Pending Billing

7. To make the field name column editable, select **Is Editable**. Clearing the **Is Editable** check box, makes the field read-only.
 Note: If you select **Display Type** as *Installed Product*, the Is Sortable check box is displayed. To make the field name column sortable, select the Is Sortable check box. Note: For **Selling Term**, and **Selling Frequency** columns to be editable, apart from selecting the **Is Editable** check box, ensure that **PriceType** for the corresponding product is set as either *Recurring*, *Usage*, or *Included Usage*. Additionally, for **Selling Frequency**, ensure that **Allow Proration** check box is selected on the price list item.
8. In the **Style** column, type values separated with a colon to change the default appearance of a field. Example 1: If you want to resize all the columns in the cart, type *width: 30px;text-align:left*. Example 2: If a product name is lengthy and is not displayed properly on the shopping cart page, type *text-align: left; width: 300px; max-width: 300px; display: block;white-space:0px;*. The product name is wrapped and displayed completely on the cart page.
9. In the **Style Class** column, type one of the following to change the way dynamic columns are displayed:
 - *aptCurrency*
 - *aptQuantity*
 - *aptPercentage*

- *aptAdjustmentType*
- *aptAdjustment*

Note: These style classes apply two decimal points to the fields accordingly. You can change the number of decimal places from **Config Settings > System Properties** using the *Currency Field Precision*, *Percentage Field Precision*, and *Quantity Field Precision*.

- In the **Header Style** column, type values separated with a colon to change the default appearance of the header of a column. For Example: *width:200px;*
- You can also do one or more of the following:
 - To add or delete a row, use the  and  icons.
 - To re-order the rows, use the  and  icons.
- Click **Save**.

The columns are displayed as configured in the Display Columns Settings.

Configuring Display Actions Settings

The Display Action Settings page provides an interface for selecting actions, applying styles, and reordering them. You can even create and use your own custom action.

In order to create custom actions, you must first create a custom label.

To create a custom label

- Go to **Setup > Create > Custom Labels** and click **New Custom Label**.
- Type a mandatory **Short Description** and type a mandatory **Name**.
- In **Categories**, type comma-separated values that can be used in filter criteria when creating custom label list views. For example Pages, Label, Components, and more.
- In **Value**, type mandatory text in the form of a brief description or copy and paste the field name from Step 1.
- Click **Save**.

A custom label is created and saved.

To change a custom label

- Go to **Setup > Create > Custom Labels** and search for **Change** label with Installed Products Change Action as the short description.
- Click the Change label. The system displays the Custom Label Detail page.

3. Click the button, **New Local Translations/Overrides** in the Local Translations/Overrides section. The system displays the New Translation page.
4. Select the appropriate language from the drop-down.
5. Enter the Translation Text as an Add-on in the text box.
6. Click **Save**.

The custom label is changed.

To customize display actions

If you want to create and use custom actions, you must have an existing custom label for the action.

1. Click  (All tabs) and click **Config Settings**.
2. Click **Display Action Settings**.
3. From **Display Type**, select the page where you want to place the custom action.
4. The **Sequence** column is system-generated and based on your Display Type selection in Step 3, the Display Type column displays the line item name. The Action and Action Label Name display the default actions.
5. You can create a custom Action button, where the **Action** column name is CustomAction <number> and in **Action Label Name** column, type the field name of the custom label you created. For example: Action = CustomAction1 and Action Label Name = Edit_Quote.
6. From the **Display As** column, select one of the following:

Value	Description
Action	Select this to set the action as an action button
Task	Select this to set the action as Task menu item in the Status bar.
Action and Task	Select this to set the action as both an action button and a Task menu item.
Sidebar Action	Select this to set the action as an action button on the sidebar of the Configuration page. You can define a maximum of 3 actions in the sidebar. Only the first 3 sidebar actions in the list are valid, CPQ does not display the remaining sidebar actions on the Configuration page at all.
Nav Link	Select this to set the action as a hyperlink in the Navigation bar.
Help	Select this to set the action as a Help menu icon.

For the new UI, the behavior is as follows:

Display As	Behavior
Action	Listed as a primary button. Depending on the sequence that you have defined, only one button is placed on the top and the rest of the buttons are placed in the drop-down list.
Task	Listed as a secondary button. A maximum of 4 secondary buttons are allowed on any page.

For example, on the catalog page displayed below, **Go to Pricing, Installed Products, Save, and Compare Products** have **Display As = Task**, whereas **Abandon, Update Price, Quick Save and Finalize** have **Display As = Action**.

 **Note**

The above configuration in the new UI is valid for all the pages if you have set **Cart Theme = Nova** under Config System Properties. If you have set **Cart Theme = Classic**, the above configuration is valid for only the Cart Grid UI of the Cart page.

- From the **Action Area** column, select one of the followings to position the action:
 - Center* - For center alignment
 - Left* - For left alignment
 - Right* - For right alignment
 - More* - To add as an item under the More action button

 **Note**

Note that the alignment settings are not applicable for Nova and Grid UI.

- In the **Action Style Class** column, type one of the following available style class name for the action.

Style	Description
<i>apt-selected-btn</i>	Type this to display the button in the drop-down menu with a white background and black font color. This also indicates the step that an end-user is on.
<i>apt-left-btn</i>	Type this to display an arrow pointing left on the button.

Style	Description
<i>apt-right-btn</i>	Type this to display an arrow pointing right on the button.

Note

If you want to use your own style, create a CSS file including all of the custom styles you want in the shopping cart and upload it as a static resource. Type the name of the CSS file in **Config Settings > System Properties > CSS Override**. This enables you to use the styles defined in the CSS file as opposed to out-of-the-box styles.

9. In the **Action Page** column, in **Action Page**, type the custom Visualforce page name and in **Action Params**, type the parameter that you want to pass for your custom page. For example: `{!Apttus_QPProposal__ProposalID__c.ID}` If you leave the **Action Params** field blank, by default, the system includes the ID, Business Object ID, and Config Request ID as the dynamic parameter. Example URL: `.....CustomVFPPage?id=a10e00000018DLUEA2&retId=a0ee0000003GUCfAAO&businessObjectId=a0ee0000003GUCfAAO&configRequestId=a1ie0000000kbjTAAQ`
10. From the **Behavior** column, to specify the action page behavior, select one of the following:
 - To open within the same window, select *Self*.
 - To open in a new window, select *New Window*.
 - To open in a dialog, select *Dialog Window*.
11. From the **Action Type** column, select one of the following:
 - To redirect to another page using the custom button and not show the spinner, select *Quick Redirect*. This option ignores the unsaved changes made by the customer before clicking the custom button.
 - The other options, such as *Save*, *Quick Save*, *Submit for Approval*, and *Generate* perform the same function as the out-of-the-box action buttons.
12. To enable or disable actions, select or clear the **Is Enabled** check box.
13. To enable permanent display of the action irrespective of the setting in Step 12, select **Always Display** check box.

Scenario	Display Action
Is Enabled = True and Always Display = True	Action is displayed.

Scenario	Display Action
Is Enabled = False and Always Display = True	Action is displayed but inactive. You cannot click the action.

- Click **Save** to save the changes you made on this page.

The action is added to the list of actions to be displayed on the Visualforce pages. At any given time, if you want to disable the custom action, go to the Display Action Settings page and clear the **Is Enabled** check box.

Use Case

You can configure action buttons displayed on the Summary panel on the Configuration page. You can add a maximum of 3 buttons on the Summary panel. If you configure more 3 buttons, only the first 3 buttons are displayed on the Summary panel. The following action buttons are displayed on the Summary panel by default:

- Go to Pricing
- Update Price
- Validate

To configure action buttons on the Summary panel on the Configuration page

- Go to **All Tabs > Config Settings > Display Action Settings**.
- From the **Display Type** drop-down, select **Attribute Page**.

 You can select **Display Type** as **Bundle Page** to configure actions on the sidebar for bundle page in case of sub-bundles.

- From the **Flow** drop-down, select the flow you want to configure.
- Find the buttons you want to display on the Summary panel and define the following fields as described:

Field	Value
Display As	<i>Sidebar Action</i>
Action Area	<i>Center</i>

5. Select the following checkboxes:
 - **Is Enabled**
 - **Always Display**
6. Click **Save**.

To hide default action buttons on the Configuration page

1. Go to **All Tabs > Config Settings > Display Action Settings**.
2. From the **Display Type** drop-down, select **Attribute Page**.
3. From the **Flow** drop-down, select the flow you want to configure
4. Find the buttons you want to hide and clear the following checkboxes:
 - **Is Enabled**
 - **Always Display**
5. Click **Save**.

Configuring Custom Actions for Auto-Synch of Cart Lines

The Custom Actions feature has been enhanced to auto-synch cart lines with proposal lines and navigate to other pages. When Auto-synch is turned on, the system does validation for errors and auto-synchs the cart lines with the Proposal Lines. You can view the synched line items in the Quote/Proposal detail page under the Line Items related list. Auto-sync is done when following conditions are satisfied:

- No error produced by validation callback
- No Constraint Rules error
- No line items in price pending state
- No Must Configure product is in configuration pending state

To configure custom actions for auto-synch

1. Click  (All Tabs) and click **Config Settings**.
2. Click **Display Action Settings**, and scroll down to add a custom action button.
3. Type an **Action Label Name**, and from the **Display As** list, select *Action*.
4. Select an **Action Area**, and in **Action Style Class**, specify a style class.
5. In **Action Page**, type the name of the Visualforce page that appears when the action button is clicked.
6. In **Action Params**, type *autoSync=true*.
7. In **Behavior**, select an option of how you want the action page to open.

 The auto-synch custom actions should not have action type (Save, Quick Save, Generate) specification.

8. To enable the custom Action button, select **Is Enabled**.
9. To always display the custom Action button whether enabled or disabled, select **Always Display**.

A custom action is created with auto-synch capability.

Configuring Flows

As an administrator, you can now vary the Catalog, Options, Attributes, Installed Products and Cart pages that an end user interacts with as well as the data and actions within those pages based on the end user profile and other business rules. This is made possible by introducing the concept of Flows. Flows are groups of pages that are assigned to each step in the CPQ process. Earlier the only option to set up the Visualforce pages was through custom settings.

You can now use Flow Settings to assign custom or out-of-the-box pages to each step and configure the fields and actions that are visible within each page. You can then create criteria that would determine the Flow which in turn determines the pages that are displayed when an end user clicks the Configure Products button. These flow settings once setup, override the Visualforce pages setup in custom settings.

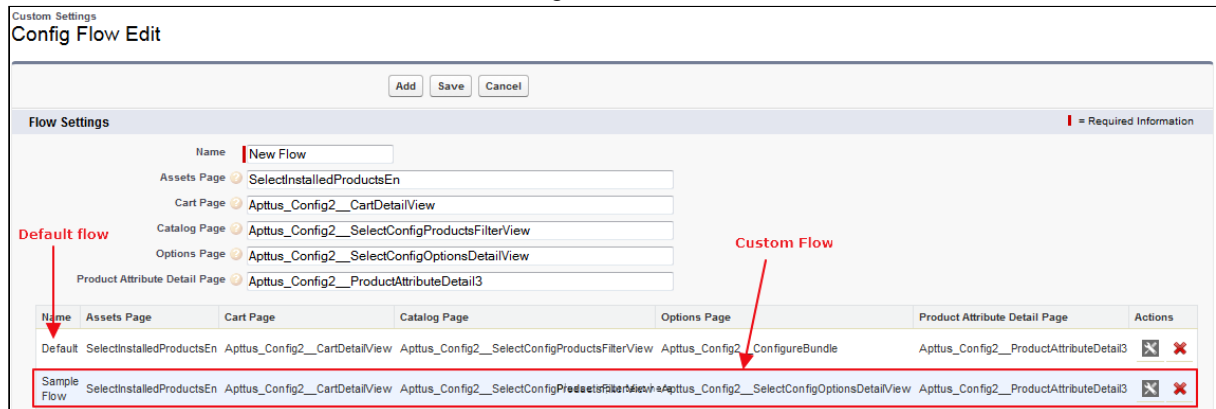

- [To create flows using flow settings](#)
- [To set up the configure products button to use the flow](#)
- [To set up columns and actions for flows](#)

To create flows using flow settings

1. Click  and click **Config Settings**.
2. Click **Flow Settings**.
3. In **Name**, type a name for the flow. For example: Sample Flow
4. Type the Visualforce pages in the following fields:
 - Assets Page
 - Cart Page
 - Catalog Page
 - Options Page
 - Product Attribute Detail Page

Hover the mouse over  to see valid values for each field.

- To add the new flow, click **Add**. An entry is added to the list below.

Custom Settings
Config Flow Edit

Flow Settings ! = Required Information

Name

Assets Page

Cart Page

Catalog Page

Options Page

Product Attribute Detail Page

Name	Assets Page	Cart Page	Catalog Page	Options Page	Product Attribute Detail Page	Actions
Default	SelectInstalledProductsEn	Apttus_Config2__CartDetailView	Apttus_Config2__SelectConfigProductsFilterView	Apttus_Config2__ConfigureBundle	Apttus_Config2__ProductAttributeDetail3	 
Sample Flow	SelectInstalledProductsEn	Apttus_Config2__CartDetailView	Apttus_Config2__SelectConfigProductsFilterView	Apttus_Config2__SelectConfigOptionsDetailView	Apttus_Config2__ProductAttributeDetail3	 

Default - When there is no flow created, the system uses the Default flow.

Custom Flow - In this example, Sample Flow is the custom flow created.

- Click **Save**.

A new flow is added and saved. Use the flow name you just created in the parameter to pass on for the Configure Products button.

To set up the configure products button to use the flow

You must have an existing flow.

- Go to **Setup > App Setup > Create > Objects**.
- Scroll down to select the Quote/Proposal object and from the **Custom Fields & Relationships** related list, select **Configure Products**.
- Click **Edit** and insert the flow name in the parameter as below.

```
IF ( LEN(Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=" &Id+'&flow=Sample Flow', IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)where flow=<name of the flow you created>
```

- Click **Save**.

The parameter is saved for the Configure Products button. On the Quote/Proposal page when you click the Configure Products button, all the pages appear as defined in the flow. You can modify the columns and actions that you want to use with the flow you created.

To set up columns and actions for flows

You must have an existing flow.

1. Click **+** and click **Config Settings**.
2. For setting up columns or actions or both for the custom flow, do one or more of the following:
 - For columns, click **Display Column Settings**
 - For Actions, click **Display Action Settings**
3. Select a **Display Type** and from **Flow**, select the flow you created.

4. Click **Save**.

The custom display columns and actions are set for the flow you created. All the Visualforce pages that you set up in the flow are displayed with the columns and actions set up in the config settings. If you select Default flow, the system displays the columns and actions set up in the Default flow. Clicking the Load Default Settings button will override all the columns and action settings to out-of-the-box settings in the Default flow.

Creating Promotional Banners

When a user transitions between pages (such as from the Catalog page to the Shopping cart), a progress bar is displayed. The text and image can further be customized to provide relevant information to the user such as promotional or informational messages.

You can configure the following banners:

- **Progress Bar:** Enables you to display text underneath the Progress Bar during pricing. You can specify multiple text messages to be shown and the sequence in which they appear by specifying multiple progress bar settings.
- **Marketing Banner:** Enables you to display image or text underneath the banner text (if specified) or progress bar. You can specify multiple marketing banners to be shown by specifying multiple Marketing banner settings. The sequence in which Marketing Banners appear is completely random.

To create banner settings

If you want your Banner message to be of type text ensure that you create a custom label for the same. If you want to specify an image in the banner, ensure that an image is saved as a static resource in your org.

1. Go to Custom Settings > Banner Settings > Manage > New.
2. Specify a name for the setting.
3. Do any one of the following:
 - To specify a banner of type text, enter the BannerMessageContext as Progressbar.
 - To specify a banner of type image, enter the BannerMessageContext as Marketing.
4. Specify the BannerPageContext as Pricing. The banner appears when the pricing callback is invoked on click of a button and the user is navigated to a new page.
5. Do any one of the following:
 - If the BannerMessageContext is Progressbar, specify the custom label name as the BannerSource.
 - If the BannerMessageContext is Marketing, specify the URL of the image stored in static resources as the BannerSource.
6. Do any one of the following:
 - If the BannerMessageContext is Progressbar, enter CustomLabel as the BannerType.
 - If the BannerMessageContext is Marketing, enter ImageURL as the BannerType.
7. Specify the sequence in which the banner appears. The sequence you specify for the textual banner, is the sequence in which the banner messages appear to the user. The sequence field is applicable only when the BannerMessageContext is Progressbar.
8. Click Save.
9. Repeat Steps 1-8 to create multiple textual or image banners to be shown to the user. The Progressbar banners appear in the sequence in which they are defined. The Marketing banners appear randomly.

The banner settings are saved and created successfully.

Hiding the Clone Icon for a Cart Line Item

You can now choose to hide the clone icon for a specific cart line item. If you select the **Hide Copy Action** check box at **Config Settings > System Properties**, it hides the clone icon for all the line items in the cart. For a Line Item Object there is a new field - **Hide Copy Action** of type *Boolean* which enables you to hide the clone icon for a particular line item.

Scenario: Suppose you have configured two products A and B and you want to hide the clone icon whenever the user selects a product with an attribute of color *Red*. Create a workflow rule with a criteria Line Item: **Color** equals *Red* and the workflow action as Field Update on the Line Item Object and the Field to Update as Line Item: Hide Copy Action and set the new field value as *True*.

Following are the values that you can set in the **Hide Copy Action** check box with the subsequent results:

Hide Copy Action System Property	Workflow Rule Field Update Value	Result at the Line Item
True	True	Clone icon hidden
True	False	Clone icon hidden
False	True	Clone icon hidden
False	False	Clone icon displayed.

To hide the clone icon for a cart line item

1. To hide all the line items, navigate to **Config Settings > System Properties**, and select the Hide Copy Action check box.
2. Create a workflow rule for a Line Item Object with an appropriate rule criteria.
3. Set the Workflow action as **Field Update** and set the field to update on **Line Item Object** and the **Field to Update** as *Line Item: Hide Copy Action* and set the new field value to *True*.

The clone icon is hidden for a cart line item based on the **Hide Copy Action** value in System Properties and the Workflow Rule Action.

Configuring Product Footnotes

Product Footnote object and two other objects: Proposal Footnote and Agreement Footnote enable you to dynamically include static *footnote* content in your quote/proposal documents, based on the products that are included in the quote as Proposal Line Items.

When a quote is finalized, the system creates corresponding Proposal Footnotes records. Merge Fields for this related object must be used in the proposal type templates. Similarly, for the agreement documents and agreement type templates merge fields from the

Agreement Footnotes object must be used for the system to bring footnotes for the included Agreement Line Items.

Currently, the system supports multiple Footnotes for the same product; each being a text for up to 4000 characters on separate lines. Only unique footnote records are brought by the system to the context object level on finalization. Footnotes for the line items of the type: Product/Service, i.e., standalone products or bundles, are supported.

To create product footnotes

1. Select a product and from the Product Detail section, click **Product Console**.
2. Scroll to Additional Data and click **Terms** to display the New Footnote page.
3. Type a **Footnote Name** and type the text of the footnote in **Body**.
4. Type a mandatory **Sequence** and click **Save New Footnote**.

The footnote record is saved and associated to with the product and automatically added to the Footnotes related list.

You can go to the New tab and add another footnote.

You can go the Associate tab and search for an existing footnote to add to this product's Footnotes related list. You can associate only one footnote per product, but a footnote can be associated to more than one product.

From the Edit tab you can make changes to the footnote or click Remove and choose to remove it from this product or any other products it has been associated with.

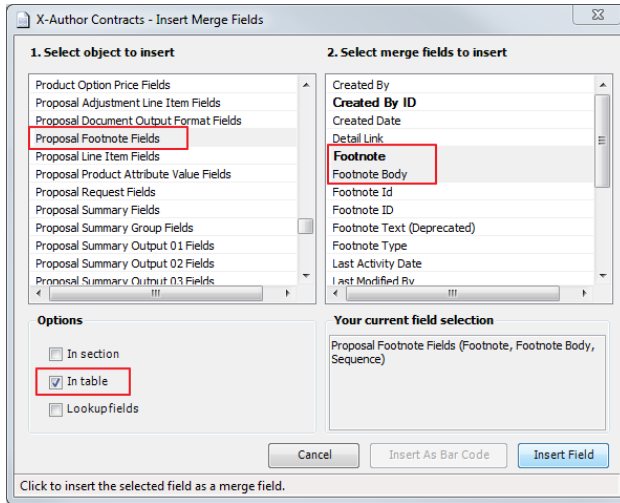

The newly created footnote can also be associated with other products.

To create a proposal type template

You must have existing product footnotes.

1. Login to X-Author Contracts, select the **X-Author Templates** tab and check out an existing proposal template (or create a new proposal type template).
2. Place the cursor in the template where you want the footnotes and click **Insert Merge Fields**.

- From the 1. *Select object to insert* pane, locate and select **Proposal Footnote Fields**.

- From the 2. *Select merge fields to insert* pane, select the fields that you want to insert.
- From the *Options* section, select **In Table** and click **Insert Field**.

The merge fields are entered into the document template.

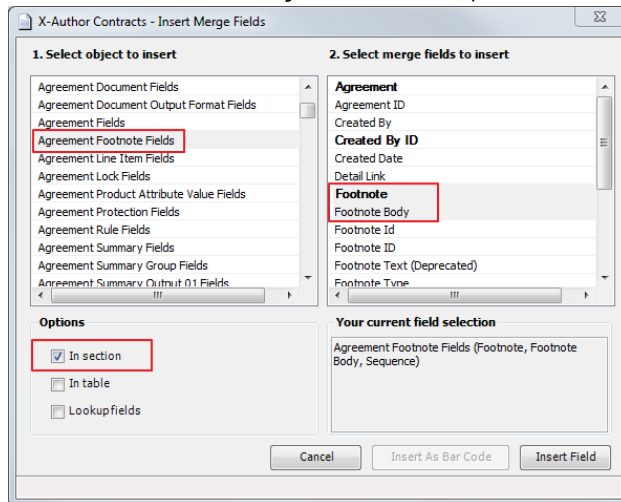

Proposal Footnotes in TABLE		
Sequence	Footnote	Footnote Body
{ MERGEFIELD Apttus_QPConfig__ProposalFoot note_start * MERGEFORMAT}{ MERGEFIELD ProposalFootnote_Sequence * MERGEFORMAT }	{ MERGEFIELD ProposalFootnote_FootnoteId * MERGEFORMAT }	{ MERGEFIELD ProposalFootnote_FootnoteBod y * MERGEFORMAT }{ MERGEFIELD Apttus_QPConfig__ProposalFoot note_end * MERGEFORMAT }

To create an agreement type template

You must have existing product footnotes.

- Login to X-Author Contracts, select the **X-Author Templates** tab and check out an existing proposal template (or create a new proposal type template).
- Place the cursor in the template where you want the footnotes and click **Insert Merge Fields**.

3. From the *1. Select object to insert* pane, locate and select **Agreement Footnote Fields**.

4. From the *2. Select merge fields to insert* pane, select the fields that you want to insert.
5. From the *Options* section, select **In Section** and click **Insert Field**.

The merge fields are entered into the agreement template.

```

Agreement Footnotes in Section
{ MERGEFIELD Apttus_CMConfig__AgreementFootnote_section_start \* MERGEFORMAT }
{ MERGEFIELD AgreementFootnote_FootnoteId \* MERGEFORMAT }
{ MERGEFIELD AgreementFootnote_FootnoteBody \* MERGEFORMAT }
{ MERGEFIELD AgreementFootnote_Sequence \* MERGEFORMAT }
{ MERGEFIELD Apttus_CMConfig__AgreementFootnote_section_end \* MERGEFORMAT }

```

Retaining the Order of Line Items in a Generated Proposal Document

The sequence of the Line Items on the Cart depends on the addition and configuration of the products on the Catalog and Configuration pages. Using the drag and drop feature, a Sales Rep can rearrange the Line Items on the Cart and retain the rearranged sequence in a generated Quote/Proposal document.

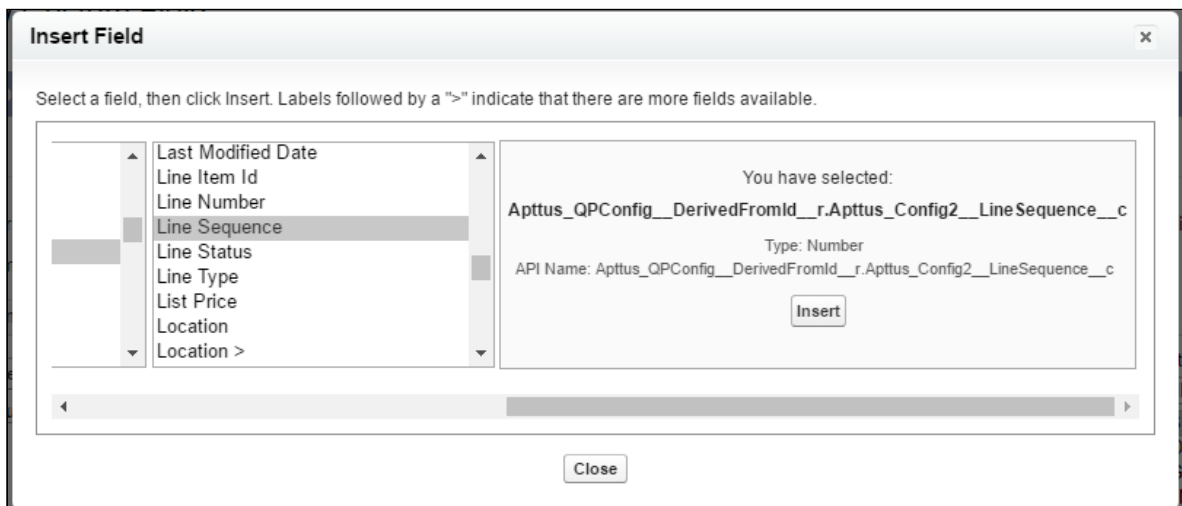

To retain the order of the Line Items from the Cart to the Generated Quote/Proposal document, you must perform the following procedures:

- [Create new formula fields for Line and Option Sequence](#)
- [Create an Admin entry for Line and Option Sequence](#)

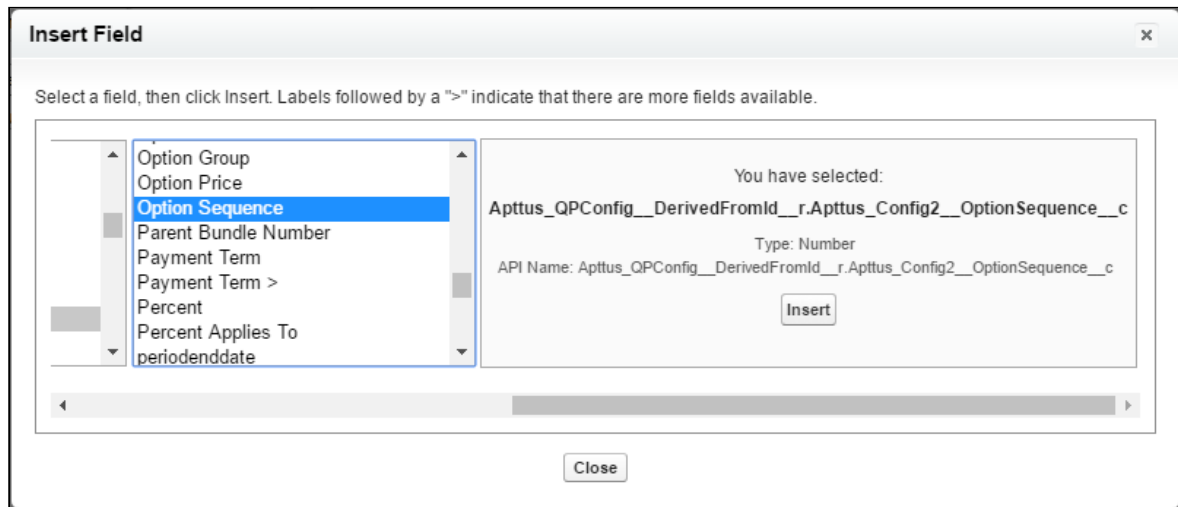

Creating new formula fields for Line and Option Sequence

You must create two new custom formula fields for Proposal Line Item object, which must be derived from **Line Sequence** and **Option Sequence** fields of Line Item object.

1. Go to **Setup > Create > Objects** and click **Proposal Line Item**.
2. In the Custom Fields & Relationships related list, click **New** and create a new Formula field.
3. Enter the field Label as *Sequence Line* and choose the **Formula Return Type** as *Number*.
4. Choose the Advanced Formula tab and build the formula field using the flow- **Proposal Line Item > Derived From > Line Sequence**.

5. Grant the necessary Field Level Security, assign the new custom field to the Page Layouts and click **Save**.
6. Repeat step: 2 to 5 for creating a new custom formula field for *Sequence Option* field, which will be derived from the formula- **Proposal Line Item > Derived From > Option Sequence**.

Creating an Admin entry for Line and Option Sequence

1. Click  and click **Admin**.
2. Do any one of the following:
 - Click **New** to create a new Admin entry.
 - Click **Edit** for an existing admin property *APTS_ProposalConfig*.
3. In the **Name** field, type *APTS_ProposalConfig* and in the **Value** field, type *XML*.
4. In the **Code** field, type the following code:

```

<ComplyConfig>
<SortSpec>
<SortObjects>

</ComplyConfig>

```

Depending upon your business object (Quote/Proposal or Agreement), you can enable this for ProposalConfig or ComplyConfig respectively.

5. All the tags defined over here are available in the *ProposalConfigSchema* static resource. To view this static resource, you may navigate to **Setup > Develop > Installed Packages > Apttus Proposal Management (Managed) > View Components > ProposalConfigSchema > View file**.
6. Click **Save**.

Now when you generate a Quote/Proposal document, the rearranged sequence of the Line Items is reflected.

Updating the sequence of options in bundles that are reordered might cause CPU time out error. Apttus recommends refraining from updating the option sequence after reordering the bundle. You must add an admin entry to disable the sequencing of options.

⚠ Updating the sequence of options in bundles that are reordered might cause CPU time out error. Apttus recommends refraining from updating the option sequence after reordering the bundle. You must add an admin entry to disable the re-sequencing of options by following the steps below:

1. Click All Tabs icon (**+**) and click **Admin**.
2. Click **New** to create a new Admin entry.
3. Fill the following details

Field	Value
Name	<i>APTS_IncludeBundleOptionsForResequencing</i>
Value	<i>false</i>
Code	Leave the field blank

4. Click **Save**.

Synchronizing Related Line Items with Opportunity Line Items

As an administrator, you can enable synchronization of related line items with opportunity line items. The following are the methods of synchronization:

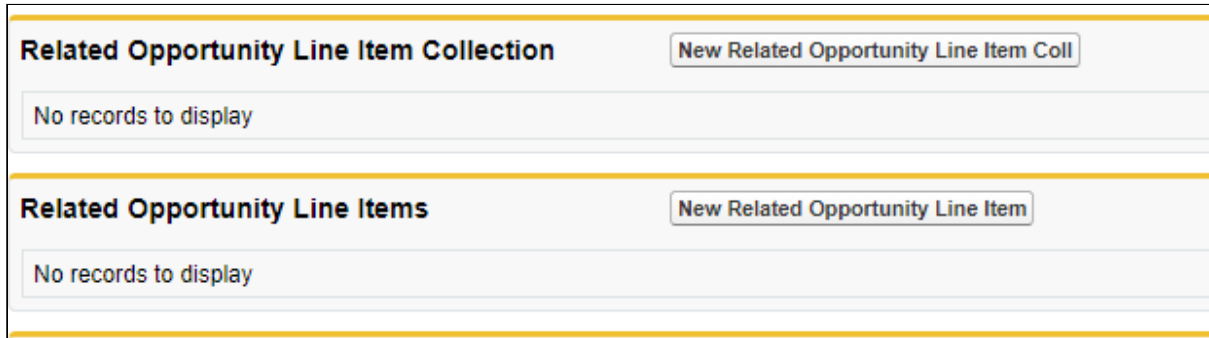

i This feature is used only in Service CPQ.

Auto-Synchronization

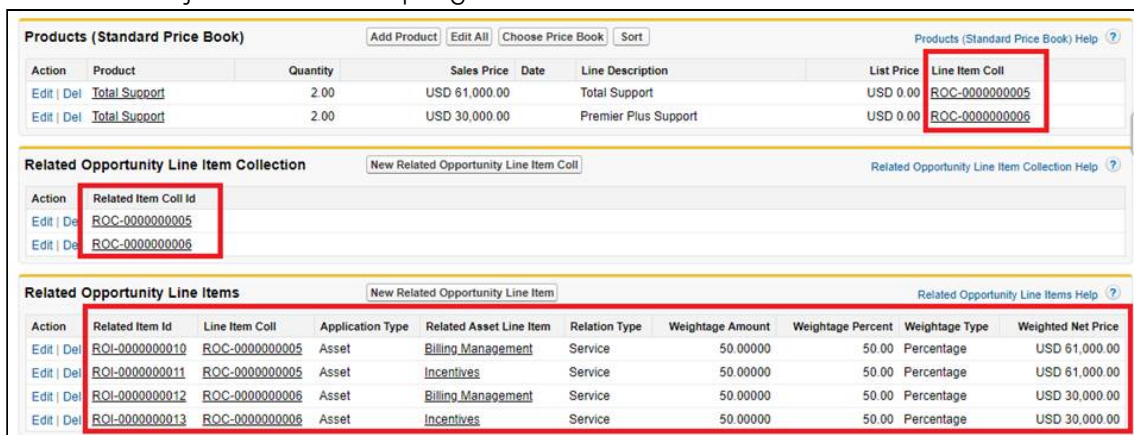

1. Enable the **Auto Sync With Opportunity** setting in the Proposal System Properties custom setting.
2. Create a lookup field with API name *LineItemCollId__c* on the *Opportunity Product* object with a lookup relationship to the *Related Opportunity Line Item Coll* object.

Opportunity Product Custom Fields & Relationships				
Action	Field Label	API Name	Installed Package	Data Type
Edit Replace ↓	Approval Status	Apttus_Approval__Approval_Status__c	Apttus Approvals Management	Picklist
Edit Del	Line Item Coll	LineItemCollId__c		Lookup(Related Opportunity Line Item Coll)

3. Display related lists **Related Opportunity Line Item Collection** and **Related Opportunity Line Items** on the opportunity layout.

4. Ensure that the **Primary** checkbox is selected on the quote and the opportunity has a price book associated with it.
5. When you finalize the quote, you observe that:
 - a. Proposal line items synchronize on the *Opportunity Product* object.
 - b. The lookup field with API name *LineItemCollId__c* is populated with a related item collection ID.
 - c. Each record in the *Opportunity Product* object has a unique related Item collection ID.
 - d. The *Related Opportunity Line Item Collection* object links the opportunity product to the related line items associated with it. For every record in the *Opportunity Product* object, which has related lines associated with it, a unique *Related Opportunity Line Item Collection* is created.
 - e. In the *Related Opportunity Line Item Collection* related list, the *Related Item Coll Id* of all collection records is displayed.
 - f. The *Proposal Related Line Items* are synchronized with the *Related Opportunity Line Items* object and are displayed in its related list.

Manual Synchronization

1. Disable the **Auto Sync With Opportunity** setting in the Proposal System Properties custom setting.
2. Create a lookup field with API name *LineItemCollId__c* on the *Opportunity Product* object with a lookup relationship to the *Related Opportunity Line Item Coll* object.

Opportunity Product Custom Fields & Relationships				
Action	Field Label	API Name	Installed Package	Data Type
Edit Replace Down Arrow	Approval Status	Apttus_Approval__Approval_Status__c	Apttus Approvals Management	Picklist
Edit Del	Line Item Coll	LineItemCollId__c		Lookup(Related Opportunity Line Item Coll)

3. Display related lists **Related Opportunity Line Item Collection** and **Related Opportunity Line Items** on the opportunity layout.

Related Opportunity Line Item Collection	
New Related Opportunity Line Item Coll	
No records to display	

Related Opportunity Line Items	
New Related Opportunity Line Item	
No records to display	

4. Ensure that the **Primary** checkbox is selected on the quote and the opportunity has a price book associated with it.
5. Ensure that **Synchronize with Opportunity** formula button is displayed on the proposal layout.
6. Finalize quote and click **Synchronize with Opportunity**.
Observations are same as step 5 in [Auto-Synchronization](#).

i The options of the service bundle are synchronized to the opportunity only if the **Sync Option Products** setting is enabled in the Proposal System Properties custom setting.

Configuring Large Document Generation for Quote

You can use the Large Document Generation feature to generate documents for quotes with a large number of line items. The document generation for a large quote is processed asynchronously in small chunks based on the threshold and batch size and the resultant document is attached to **Notes and Attachments**. This feature is available in the **Generate** button and not available in the DocGen, **Send Proposal** button.

You must define the following settings to allow the Sales rep to generate a document for a quote with a large number of line items. You need to define a threshold and a batch size for the number of line items in the quote. When the number of line items in the quote exceeds the threshold, the quote is considered a large quote. The line items in the large quote are processed in the smaller chunks based on the batch size you defined.

You must take into consideration the template that the Sales rep uses to generate the document before defining the batch size. For example, if the template includes information about only line item fields is considered a simple template and can have large batch size. Similarly, a template that has too many line item fields, attribute information, adjustment line details would be considered a complex template and should have a small batch size.

To define the threshold and batch size.

1. Go to **Setup > Develop > Custom Settings > Proposal System Properties > Manage**.
2. Find **System Properties** and click **Edit**.
3. Define the fields mentioned in the table

Field	Description
Enable File	Select the checkbox to enable files in the quote
Enable Submit Merge Call	Select the checkbox to enable the Submit button on that
Large Doc Threshold	Enter a number in the field. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> The default and the maximum value of the Large Doc Threshold is <i>10000</i>. You can define a value lower than 10000. Setting a value of <i>-1</i> for the Large Doc Threshold invalidates the setting.</p> </div>

Feild	Description
Large Doc Process Batch Size	<p data-bbox="703 320 1046 349">Enter a number in the field.</p> <div data-bbox="703 383 1426 786" style="border: 1px solid #ccc; padding: 10px;"><p data-bbox="727 405 1382 562"> The default and the maximum value of the Large Doc Process Batch Size is 2000. You can define a value lower than 2000, based on template complexity.</p><p data-bbox="780 568 1390 757">The default batch size for order line item creation and order activation is 100 unique bundle lines. This means 100 unique products on the cart (each product can have multiple line items).</p></div>

4. Click **Save**.

Managing Guided Selling

Guided Selling is a process that helps a sales representative to choose the product best fulfilling a customer's needs. The goal of guided selling is to provide an inexperienced sales representative the way to figure out which product to sell to a customer.

During the quoting process, the sales representative answers a set of questions around the customer's needs and based on their answers, the system recommends products. This way a sales representative can quickly select the right product to meet a customer's needs.

To configure and set up Guided Selling, you must do the following:

- Prepare a list of questions and answers to be displayed on the guided selling page. You should decide which questions to ask the customer and based on which product characteristics you want to filter the products.
- [Create a custom field in Search Attribute Value object for each question.](#)
- In Product object, create custom fields that you created in the Search Attribute Value object.

 API Name must be the same as Search Attribute Value object.

- [Create a flow using Salesforce Flow Designer.](#)
- [Create a guided selling visualforce page.](#)
- [Define Guided Selling Rules.](#)

Creating Custom Fields in the Search Attribute Value Object

You must create custom fields in the search attribute value object to correspond to questions.

Search Attribute Value is the object that stores the answers to the questions that an end user gives everytime they go through guided selling. You need to create a custom field in *Search Attribute Value* object for each question. The value stored in the question field is the actual answer given to the question by the representative.

Example: You have a question *Does customer need 24X7 toll-free support?*. In Search Attribute Value object, create a field *Does customer need 24X7 support*.

 Name does not have to match the question.

The answer the sales representative gives to the question is stored in the custom field.

Creating a Sample Flow Using Flow Designer

Salesforce Flow Designer helps you create a flow by defining questions and answers that you may want to allow the end user for filtering products.

Below is an example on how to setup a simple flow using Salesforce Flow Designer. For detailed information on various ways to create a flow, see [Creating a Flow](#).

Say you want the end user to answer a question and based on the selection, you want the system to recommend products. Here is an example:

- [Add a variable](#)
- [Add a Screen Element](#)
- [Add a Record Update Element](#)
- [Set a Start Element](#)

To create a flow

1. Navigate to **Setup > Create > Workflow & Approvals > Flows**.
2. Click **New Flow**.
3. From the Palette in the left pane, click and drag a Screen element onto the canvas to configure it.
4. From the Palette in the left pane, click and drag a Record Update element onto the canvas to configure it.
5. Click **Save**.
6. In **Flow Properties**, enter a mandatory **Name** and press TAB. The Unique Name is auto-populated.
7. Enter a **Description** and click **OK**.

A flow is created and saved.

After the flow is created, to make the flow active, click **Activate**.

To add a variable

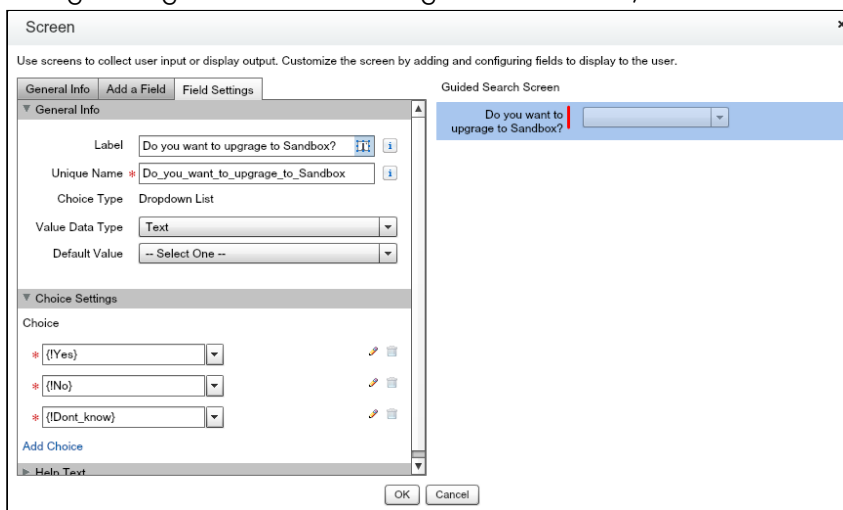

1. Navigate to **Setup > Create > Workflow & Approvals > Flows**.
2. Go to the **Resources** tab and from **CREATE NEW**, double-click *Variable*.
3. In Unique **Name**, type *InterviewId*.
4. Enter a **Description**.
5. From **Input/Output Type**, select *Input and Output*.

6. Click **OK**.

InterviewId is added as a variable.

To add a screen element

1. Enter a mandatory **Name** and press **TAB**. The Unique Name field is auto-populated.
2. Click the **Add a Field** tab and double-click Dropdown List. A Dropdown List field appears in the preview pane.
3. Double-click the Dropdown List field in the preview pane to configure it.
4. On the **Field Settings** tab, enter a mandatory **Label** and press **TAB**. The Unique Name field is auto-populated. For example: Label is *Do you want to upgrade to Sandbox?*, the Unique Name will be *Do_you_want_to_upgrage_to_Sandbox*.
5. In the **Choice Settings** section, next to **Select Resource** click .
6. Expand the **CREATE NEW** section, and select **Choice**.
7. Enter a mandatory **Label** and press **TAB**. The Unique Name is auto-populated.
8. In **Stored Value**, type Yes as the answer choice and click **OK**.
To enter more than one choices, repeat steps 7 through 10. For Example: Enter *No* and *Don't know* as another answer choices.
9. Verify that your Screen overlay looks like this, and click **OK**.

The screen element is added.

To add a record update element

You must have created a screen element.

1. From the Palette in the left pane, click and drag a Record Update element onto the canvas.

2. Enter a mandatory **Name** and press **TAB**. The Unique Name field is auto-populated.
3. From **Update** > **Custom**, select *Apttus_Config2__SearchAttributeValue__c*.
4. From **Field** > **Standard**, select *Id*.
5. From **Operator**, select *equals*.
6. From **Value** > **Variables**, select *InterviewId*.
7. Under Update record fields with variable, constant, input, or other values, from **Field** > **Custom**, select the Custom field you created.
8. From **Value** > **Screen Choice Fields**, select the screen choice you created.
9. Click **OK**.

A record update is added.

To connect elements and set a start element

You must have added the element to the flow.

1. Click and drag an arrow connector from the Screen element to the Record Update element.

2. To set the screen element as the start element, click .

The elements are connected and a flow chart is ready with a start element.

A Visualforce page is required to be created to display the flow you just created using the Flow designer. Create a [Guided Selling Visualforce page](#) to display the flow.

Creating a Guided Selling Visualforce Page

A Visualforce page needs to be created to display the flow you just created using Flow Designer.

To create a guided selling Visualforce page

1. Go to **Setup > App Setup > Develop > Pages**.
2. Click **New**.
3. Enter a mandatory **Label** and a mandatory **Name**.
There should be no spaces in **Name**. Example: *NameWithNoSpace*.
4. In your code for the visualforce page, enter the **Interview Name**.
The interview name is the Flow Name.

```
<flow:interview name="Guided_Selling_Flow_Test" buttonLocation="bottom"
  finishLocation="{!$CurrentPage.URL}&interviewId={!InterviewId}
  &step=Option" reRender="dummy" rendered="{!IsBundleStep}" >
  <apex:param name="InterviewId" value="{!InterviewId}" />
</flow:interview>
```

5. Click **Save**.

You can now [define guided selling rule](#).

Defining Guided Selling Rules

Guided Selling Rules map the search attributes in Apttus to product attributes for filtering.

To define the guided selling rule, you must create a guided search rule with a guided search rule entry and a guided search rule filter. The system filters the products based on the answers to the questions.

For example: In the **Search Attribute Value** object, you have a created a custom field **Number of users for the server**. You want the system to filter the products on their **Number of users** field.

- [To define a guided selling rule](#)
- [To add a guided search rule entry](#)
- [To add a guided search rule filter](#)

To define a guided selling rule

You must have already created custom fields in the **Search Attribute Value** object.

1. Navigate to the CPQ Console tab.
2. From the Rule Management section, click Add Guided Selling Rule.

3. In the New Guided Selling Rule section, type a mandatory Rule Name.
4. Type a Description and enter a mandatory Category.
5. In **Guide Page**, enter the guided selling Visualforce page name.
6. To make the guided selling rule active, select **Active**.
7. In **Effective Date**, enter a date from when the rule is effective.
8. In **Expiration Date**, enter an expiry date for the rule.
9. Click **Save**.

A guided selling rule is created and saved.

You can now add guided search rule entries.

To add a guided search rule entry

You must have already defined a guided selling rule.

1. In the Guided Search Rule Entry section, select a Question.
2. Select an Operator and type a Value.
3. To add more than one entry, click **Add Entry**.
4. Click **Save**.

Guided search rule entry is added.

You may want to add guided search rule filters.

To add a guided search rule filter

You must have a guided selling rule defined along with a guided search rule entry.

1. In the Guided Search Rule Filters section, select a Field and select an Operator.
2. From Map To, select **Question** or **Value**.
3. If you select Question in Step 2, you can see the list of fields in the Search Attribute Value object and select one of these fields. -OR- If you select Value in Step 2, you can enter a value in the Question / Value column.
4. To add more than one filters, click **Add Filter**.
5. Click **Save**.

Managing Promotions

The Apttus Promotion Management package is available as an add-on with the CPQ license and package.

With the Apttus Promotion Management package, you can incentivize the sales of products in your inventory. Promotions add value to product through discount pricing and add reward for purchase. Promotions provide value for money for your customers and contribute to better sales for your organization.

If you are a marketing manager or are responsible for promoting some products over others, you use historical transaction and sales data to create promotions. You can use promotions to:

- build traffic to the storefront
- create extra interest in product offering
- introduce new product, generate trial, or increase penetration in a specific market or segment
- increase sales of products during down-period
- provide competitive pricing to products during heavy competition
- increase revenue margins
- enhance customer retention
- clear stocks of a product that is about to reach end-of-life
- sell excess Inventory
- motivate staff

A promotion is a marketing technique that you apply to reduce the list price of a product or a service. A promotion consists of all non-tech activities that marketers use to try to increase sales over a specific period of time. You can create such promotions and restrict their scope, limit, and benefits so that your sales representatives can apply promotions to specific products, for specific customers, and for a limited period.

See the [Promotions Workflow](#) to understand how Promotions work.

Usage of Promotions

In the [Managing Promotions](#) section, you can quickly find out how Promotions Management works and how you can manage your organization's business requirements with respect to Promotions.

If you are a Marketing Manager, you will learn to

- [Create and edit promotion plans](#)

- Submit promotions for approval
- Approve or reject requests for approval
- [Analyse the impact and effectiveness of promotions on quotes and orders](#)

If you are a Marketing Executive, you will learn to

- [Analyze the Impact of promotion on quotes and orders](#)
- Analyze the effectiveness of promotions

If you are a sales representative, see "Applying Promotions on the Products in the Shopping Cart" in *CPQ on Salesforce User Guide* to learn how to

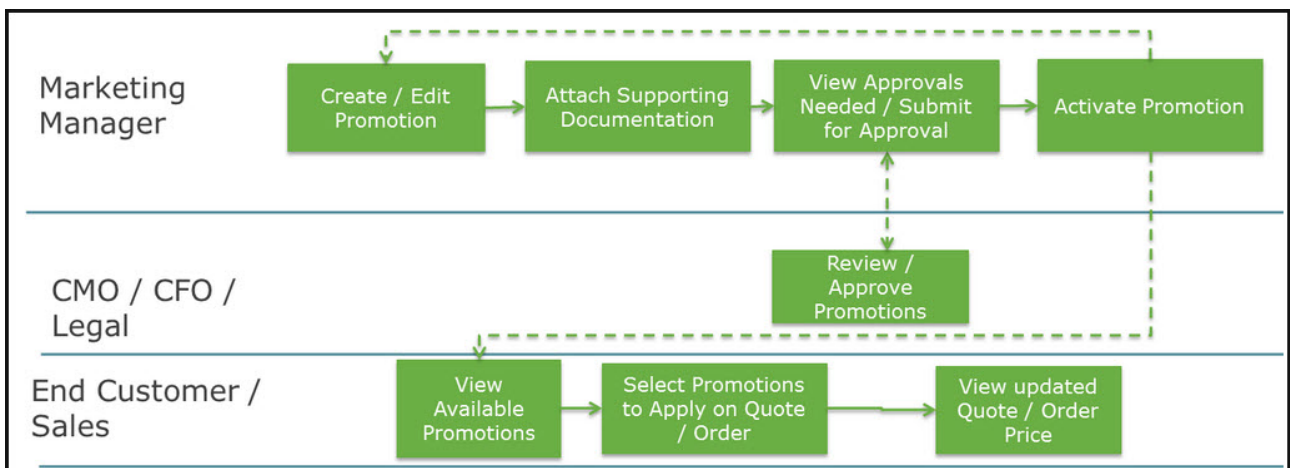

- View the available Pull promotions
- Add a promotion code and apply promotions

If you are new to Promotions Management, begin here. See [About Promotions Workflow](#) to understand the procedures and processes of creating a promotion.

About Promotions Workflow

For your organization to have a promotion event, the marketing team must first select the products to promote, define promotional pricing, and activate the promotion.

Promotional pricing may require approvals from your marketing manager and sometimes the finance and legal team.

Your sales representatives then can view the activated and available promotion to apply it on a quote or an order.

You can select from one or more different [types of promotions](#) that you want to create.

Types of Promotions

The following are the major categories of promotions that you see on the Incentives page:

- **Normal promotion:** This is the default promotion that CPQ allows you to create. Promotions are applicable on the Cart.
- **Order-level promotions:** Order-level promotions are called rebates. For more information, refer to *Rebates Management on Salesforce Administrator Guide*.
- **Sales promotion:** A marketing manager or pricing manager can define promotions that can be grouped with the adjustments defined by the Sales Representative. A sales promotion allows the Sales Representative to modify the promotion in the shopping cart and structure discounts for deals. A sales promotion can be bucketed with the adjustments defined by the Sales Representative. Adjustments that are made to the Cart for a sales promotion are listed in the adjustment bucket.

To create a sales promotion

Perform the following steps to create a sales promotion:

1. Go to **Setup > Create > Objects > Incentives**.
2. In the **Buttons, Links, and Actions** related list, click **New Button or Link**. The New Button or Link page is displayed.
3. Enter the following details:
 - a. **Label:** Enter a label for the button, for example, *New Sales Promotion*.
 - b. **Name:** Enter a name for the button. This field is auto-populated based on the Label when you click inside the field.
 - c. **Description:** Enter a description for the button.
 - d. **Display Type:** Select a display type for the button, for example, *List Button*.
 - e. **Behavior:** Select what should happen when the user clicks the button or link.
 - f. **Content Source:** Select a content source, for example, *URL*.
 - g. In formula editor, enter the following formula for the button:

```
/apex/Apttus_Config2__IncentiveManager?
DisplaySetting=Promotion&UseType=Promotion&SubUseType=Sales&DataSource=Apt
tus_Config2__OrderLineItem__c&ApplicationMethod=Buy X Get X
```

4. Click **Save**.
5. Add the new button to the layout of the Incentives page.

An action button is created on the Incentives page. You can now create a new sales promotion.

Furthermore, you can create the following types of promotion for each major category:

 You can configure how the benefit must be applied on a selected product. For example, a promotion can be a discount in price or an increased quantity of product.

Promotion Type	Description	Example
Buy X Get X	When the customer purchases a product, you offer some benefit on the same product.	As a marketing manager of a mobile phone company, you need to promote a new smart phone. You create a promotion where you offer your customers 20% discount on the price of the phone that they buy.
Buy X Get Y	When the customer purchases a product, you offer some benefit on a different product.	As a marketing manager of an e-commerce company, you need to increase the sales of a refrigerator. You create a promotion where you offer your customers a free voltage stabilizer when they buy the refrigerator.
For every X Get X	When the customer purchases a certain quantity of a product, you offer some benefit on the same product.	As a marketing manager of a telecommunications company, you need to retain existing enterprise customers. You create a promotion where you offer your customers 10% discount on the price of each subscription for every 10 subscriptions that they buy.
For every X Get Y	When the customer purchases a certain quantity of a product, you offer some benefit on a different product.	As a marketing manager of a software company, you need to provide competitive pricing to a software as a service product during heavy competition. You create a promotion where you offer your customers free training for every 10 licenses that they buy.

Configuring Promotions

With the Promotions Management application, you can now manage, execute, and analyze promotions using the Apttus CPQ product line. With the Promotions Management

application, marketing managers can create new promotions, get internal approvals for such promotions, and roll these promotions to their sales channels.

You can use the Apttus Promotions Management solution to create and manage promotions like,

- buy X get X promotions
- tiered promotions
- automatically applied promotions
- coupon-based promotions

You can apply promotions on line item and on order levels. If you have applied promotion on order level, the promotion type is restricted to Buy X get X only.

- Line item promotions (Allow User Override = true) should not display incentives with Context Type = Summary Group.
- If the promotion is “push” promotion, the promotion is auto applied to the matching quote total or total summary group.
- If the promotion is “pull” promotion, the user can select the promotion and have it applied to the matching grant group total or total summary group.
- When the user override is enabled, only display Promotions, of which the context type is "line item."

To understand how a promotion works, see the [About Promotions Workflow](#). Before you start creating a new promotion, see the available [Types of Promotions](#).

Preparing Data for Promotions

If you are a Marketing Manager, you will want to use as much data as you can get to strategize and create an effective and efficient promotion plan that guarantees fulfilling every business requirement. While you are already aware of several strategies to create an effective Incentive, you will use data and information such as:

- Price dimensions for a promotion
- Formula fields for lookup objects that you can reference in a promotion
- Child filters for the formula fields you define
- Approval workflows for a promotion
- Groups of promotions
- Create data roll-up

This data must already be available before you can implement or roll-out your promotion. This section explains how you can access data and then include or reference this data in the Incentives that you create.

Defining User Profiles and Permissions

If you are an Apttus CPQ administrator, you must first define who can access the Promotions configuration page and what actions they can perform on this page. You must create users and define permissions for each user of each profile as listed in the following table:

User	Profile	Permissions
Marketing Manager	<ul style="list-style-type: none"> • Create or edit promotion programs • Submit promotions for approval • Analyze impact of promotion on quotes or orders • Analyze promotion effectiveness 	<ul style="list-style-type: none"> • Read or Write access on all objects used for promotions management • Read access on adjustment line items, Limit Data table, rollup data, and other related objects
Marketing Executives	<ul style="list-style-type: none"> • Analyze impact of promotion on quotes or orders • Analyze promotion effectiveness 	<ul style="list-style-type: none"> • View access on Promotion objects, quotes, and proposals • Read access on adjustment line items, Limit Data table, rollup data, and other related objects
Promotion Approvers	<ul style="list-style-type: none"> • Approve or reject promotions • View or analyse promotions 	<ul style="list-style-type: none"> • Read or Write access on promotion objects • View access on all objects used for promotions
Sales Representatives	Using promotions on quotes <ul style="list-style-type: none"> • View available Pull promotions • Add promotion code and apply promotion • View promotion benefit 	View access on promotion objects, quotes, and proposals, adjustment line item objects, and Limit Data table

User	Profile	Permissions
Customers	Using promotions on the e-commerce orders <ul style="list-style-type: none"> • View available Pull promotions • Add promotion code and apply promotion • View promotion benefit 	View access on promotion objects, quotes, and proposals, adjustment line item objects, and Limit Data table

For more information of user profiles and permissions, see [Profile Settings and Security](#).

Configuring Incentive Records

With the help of custom settings, you can show or hide sections and fields of incentives that are not applicable for your business.

Hide or show sections in an Incentive record

For sections displayed in an Incentive record and more configurations, configure the following custom setting:

1. Go to **Setup > Develop > Custom Settings > Incentive Custom Display Setting**.
2. Click **Manage** next to **Incentive Custom Display Setting**.
3. Click **Edit** next to Promotions record. If there is no existing record, click **New**.
4. Enter the requisite details as follows:

Field	Description
Name	The mandatory name of the custom setting record. Enter <i>Promotions</i> here.

Field	Description
Navigation Pages	<p>The names of the sections which will appear in an incentive record on the left pane of the page. The sequence and name of the sections are defined here. The Information section is defaulted for every Incentive record.</p> <p>S: This is for the Scope section. C: This is for the Criteria section. B: This is for the Benefit section. D: This is for the Deduction section. L: This is for the Limit section. P: This is for the Coupons section.</p> <p>For example, if you specify <i>SCBL</i>, only the Scope, Criteria, Benefit, and Limit section will be displayed in the given order.</p>
Show Exclusion Criteria	This check box indicates if you want to include Exclusion Criteria along with the default Inclusion Criteria under Criteria section for an incentive record.
Application Type	The name of the incentive type where this custom setting record will be applied. Enter <i>Promotion</i> .

5. Click **Save**.

Configuring the fields displayed in an Incentive record

You can also control which standard and custom fields will be visible under different sections on your Incentive record using the following configuration.

1. Go to **Setup > Create > Objects > Incentive**.
2. Go to the **Field Sets** section and click **Edit** next to the name of the fieldset for which you want to modify the fields.
For example, if you want to edit the fields displayed in the Information Section, click Edit next to **Information Section Fields**.
3. Search for your field, add or remove it from the fieldset.
4. Click **Save**.

Creating Price Dimensions for a Promotion

When you define the scope of your promotion, you must include or exclude fields such as Region, Country, and Account, and Account Type, that impact the pricing of the purchase.

You must define a Price Dimension of one or more of these fields in Salesforce that you want to include as a parameter to define the scope of your promotion.

For example, you are a marketing manager with an Online University. You want to roll out a promotion for prospective subscribers based only in the United States. Before you can define the Geographical scope of this promotion, you must create a Price Dimension for the **Country** object.

To create a price dimension for the Country object

1. On **App Menu**, click **Apttus CPQ Admin** and then click the **CPQ Admin** tab. The new admin console is launched.
2. On the **Pricing** menu, click **Manage Price Dimensions**. A list of existing price dimensions is displayed.
3. Click **New Price Dimension**.
4. Enter the values for fields described in the following table.

Field	Description
Name	Enter a unique name for this Price Dimension.
Context Type	Select one of the following options. <ul style="list-style-type: none"> • Line Item - if this price dimension is only for the line item. • Formula Field - if this price dimension is based on the Field and Type you define below. • Child Filter - if this price dimension is based on filter criteria you define.
Business Object	Line Item (default)
Field	The field you select depends on the Context type. In this example, we selected Formula field and the objective is to create a price dimension for the Country field. The Country formula field for "Country" Price Dimension should point to the "CountryCode" field from the address as that is the field that has the pick-list associated with it.

Field	Description
Type	<p>Select from one of the following options:</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p>i The field Type is related to promotions. Based on the selected value, CPQ creates a dimension type for promotion. For example, you can create a quantity-based dimension by selecting <i>Quantity</i> from the Type drop-down.</p> <p>To set up values for the Type field, go to Setup > Create > Objects > Price Dimension (Apttus_Config2__PriceDimension__c) > Type (Apttus_Config2__Type__c) field.</p> </div> <ul style="list-style-type: none"> • Standard - for a standard promotion • Quantity - if the scope of your promotion is based on quantity • Term - if the scope of your promotion is based on the term of the subscription • Amount - if the if the scope of your promotion is based on the purchase amount • Equipment - if the if the scope of your promotion is based on equipment (Service CPQ)
Description	Describe the purpose of this price dimension so others in your organization can use it effectively.

5. Click **Save**.

For more information on Price Dimensions, see [Creating Price Dimensions](#).

Creating Formula Fields for Lookup Objects

When you define the criteria of your promotions, you will require one or more lookup fields to fetch values from objects such as Quote, Order, Account, and Contact. For this purpose, you must create Formula fields that can reference the values you have defined for the fields in these objects.

i Note

- Formula fields are not physical fields on the line item object.
- Once you setup a new Formula Field, be sure to run the **Criteria Maintenance > Update Pricing Fields**.

For example, you are a marketing manager who must define a promotion. You want to create and roll out a promotion that is applicable only to the healthcare industry. You must create a Formula field that references the Industry on the Criteria page. Here, we will create a formula field to create a look-up object.

To create a new Formula field

1. From the force.com app menu, select **Apttus CPQ**.
2. Click the **Formula fields** tab.

3. Enter values for the fields described in the following table.

Field	Description
Field Name	Enter a unique name for this new Formula Field.
Business Object	Select the business object you want to reference.
Field	Enter the API Name of the field that you want to look-up.
Description	Describe this formula field for the benefit of others in your organization.

4. Click **Save**.

Creating Child Filters

When you define the criteria of you promotion, you will require reference to Order Line item, Asset Line Item, Related Line Item, historical purchase summary, or other child objects of a look up object. These look-up objects can be Account, Contact, or User in the Promotion Criteria. You will need the **Search Filter (CPQ)** of type Child Filter. Using these child filters, you can also create the Price Dimensions to use in Benefit Matrix.

For example, you are a marketing manager who must define a promotion. You want to create and roll out a promotion that is applicable only to one specific asset. You must create a filter so you can reference the specific asset and map it to a field and specify a definite value.

To create a Search Filter,

1. Click Search Filter (CPQ) > New.

2. Enter values for the fields described in the following table.

Field	Description
Filter Type	Select Child Filter.
Business Object	Select that Object you want to create a filter for.
Value Object	Select the object whose value you want to search for.

3. Click **Next**.

4. Enter values for the fields described in the following table.

Field	Description
Filter Name	Select Child Filter.

Field	Description
Sequence	Select that Object you want to create a filter for.
Description	Select the object whose value you want to search for.
Active	Select the check-box to activate this filter.
Filter Criteria	
Field	Select the field you want to reference.
Operator	Select the appropriate operator.
Map To	Select the field that you want to map your search filter to.
Value	Select the field whose value you want to populate in the promotions criteria.

5. Click **Save**.

Creating Approval Workflows for Promotions

You can define a hierarchy so that Promotions beyond a certain dollar amount or percentage require a manager's approval. CPQ allows you to selectively turn on or off approvals at a flow level. You must set the **isCartApprovalDisabled** parameter to True in the URL that you have configured on the **Configure Products** field of the respective quote. For more information, see [Creating Custom Buttons for Different Flows](#).

To create an Approval workflow for Promotions,

1. From the force.com app menu, select **Apttus Approvals Management**.
2. Click **Approval Processes**.
3. For the **Manage Approval Process for** field, select Incentive.
4. Click **Create new Process**.
5. Enter values for the fields described in the following table.

Field	Description
Process Name	Enter a unique name to identify this specific Approval Process.
Description	Describe this process for others in your organization.
Entry Criteria	

Field	Description
Field	Select the field that you want to apply the approval trigger for.
Operator	Select the appropriate option.
Value	Enter the value that must trigger the request for approval.

6. Click **Next**.
7. According to your Business requirements, select any one or more of the following check boxes.
 - **Consolidate Approvals**
 - **Consolidate Notifications**
 - **Continue Pending approvals on a Reject**
8. Assign an Email Template.
9. Assign an Approvals page.
10. Assign a Back-up Admin user.
11. Click **Save**.

For more information Approval Workflows, see Approval Functional End User Workflow.

Configuring Data Rollups for Promotions

If you are a Marketing Manager, you will require historical purchase data of customers and what products they have purchased. This information helps you effectively strategise and plan specific details for your promotion plans.

The purpose of a data roll-up is to convert different categories of historical purchase information into variables. You can use a data roll-up to generate a result that aggregates a hierarchy of values for one or more parameters.

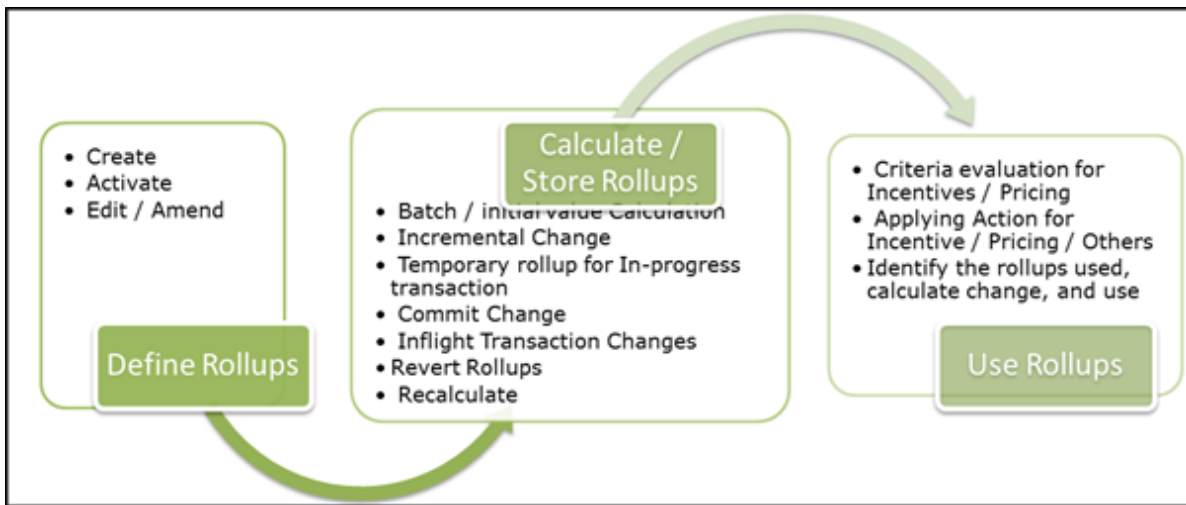

For example, you are a Marketing Manager for a global electronics and consumer durables company. One of the products you want to promote is televisions. You must consider purchase history patterns of your customers from different geographical locations before you begin to strategize your promotion plan for each location. The purchase, pricing, and applied discount patterns for TVs varies greatly from one region to another. Notably, customers in the United States are more inclined to purchase TVs and other consumer durables for Thanksgiving which is in November. Your customers in China on the other hand, are inclined to make such purchases during the Chinese New Year which is celebrated in February. There are more subtle differences such as your customers' brand loyalties that you can learn about using a data roll-up of historical purchases.

With Apttus Incentive Management, you can base your promotions on historical information such as how much your customers spent on specific products in a specific period.

The following table lists the factors you must consider and define to create a data roll-up.

Component	Description
Data Source	The Order line items and the Cart line items that your customers purchased are the source of all your historical purchase information.
Roll-up period	The period for which you want to measure the sales of a specific product or service. You must define this period with a specific Start Date and an End Date.
Roll-up function	A function is the operations you can perform with the data roll-up. At this time, SUM is the only function you can use.
Roll-up metrics	The metrics are factors that determine your customers' purchase behaviour. The two metrics you can use are <ul style="list-style-type: none"> • Quantity - the number of each product sold. You can use the Quantity metric to plan for inventory stocks, forecast projected sales and strategise an effective promotion. • Amount - the amount for which you sold each product. You can also use the Amount metric to measure the revenue you earned from each product sale and forecast revenues for the new promotion plan you want to define.
Roll-up criteria	The criteria the basis on which you roll-up historical purchase data. You can use data directly or reference it from the Account , Product , and Contact fields or their child records.
Group by	A groups is the parameter that defines how you categorize information in your data roll-up.
Roll-up scope	The scope defines the limits of your data roll-up. The scope is a mechanism to filter the list of the data roll-up that you must evaluate for a specific order.

Data Rollup Workflow

You must create a data roll-up to define the criteria, benefits, and the dimensions of a promotion plan.

Creating a Data Rollup

To create a new data roll-up,

1. Go to the Salesforce App Menu and select **Apttus Incentive Setup**.
2. Click **Incentive Rollups**. The Incentive Rollups page with existing rollups is displayed.
3. Click **New**. The Rollup Rules page is displayed.
4. In the **Rollup Information** section, enter values for the fields described in the following table.

Field	Description
Filter Name	Enter a unique name for this filter. Consult your administrator for the naming conventions you must follow.
Description	For others in your organization to learn and use this data roll-up, describe the purpose and function of this data roll-up.
Active	Select the Yes radio button to activate this data roll-up and make it available for reference in your Promotions.
Rollup Effective Date	Select a date from when the rollup is effective.

Rollup Expiration Date	Select a date when the rollup will expire.
-------------------------------	--------------------------------------------

5. In the **Rollup Value** section, enter values for the fields described in the following table.

Field	Description
Rollup Type	Select SUM from the drop-down menu.
Business Object	Select from one of the following options. <ul style="list-style-type: none"> • Asset • Asset Line Item • Product • Product Attribute Value • Product Configuration
Rollup Metric Type	Select from one of the following options. <ul style="list-style-type: none"> • Quantity - the number of each product sold. • Amount- the amount for which you sold each product.
Rollup Field	Select from one of the following options. <ul style="list-style-type: none"> • Order Line Item • Cart Line Item

6. In the **Rollup Duration** section, enter values for the fields described in the following table.

Field	Description
Rollup Frequency	Select from one of the following options. <ul style="list-style-type: none"> • One Time - for purchases that require only a one-time payment • Recurring - for purchases that are subscriptions or usage-based.
Rollup Period Source	The source of the period depends is the Business Object you defined in the Rollup Value section.

Rollup Start Date Type	<p>If you select <i>Constant</i>, only the Rollup Start Date is visible. Enter a start date for the rollup.</p> <p>If you select <i>Reference Value Source</i>, the following fields are visible. Enter values for those fields.</p> <table border="1" data-bbox="480 434 1423 1818"> <thead> <tr> <th data-bbox="480 434 810 517">Field</th> <th data-bbox="810 434 1423 517">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="480 517 810 723"> Data Source </td> <td data-bbox="810 517 1423 723"> The source of the data you want to roll-up is the Order Line Item or a child filter for which the value you define must be the Order Line Item. </td> </tr> <tr> <td data-bbox="480 723 810 1223"> Field </td> <td data-bbox="810 723 1423 1223"> The field is the parameter that determines the period for which you want to generate the data roll-up. Select from one of the following options. <ul style="list-style-type: none"> • Created Date • Effective Date • Expiration Date • Last Modified Date • Last Referenced Date • Last Viewed Date • System Modstamp </td> </tr> <tr> <td data-bbox="480 1223 810 1655"> Offset Type </td> <td data-bbox="810 1223 1423 1655"> Offset values that you define determine the start date of the period for which you are creating a data roll-up. Select from one of the following options. <ul style="list-style-type: none"> • Offset (+) Days • Offset (-) Days • Offset (+) Months • Offset (-) Months By default, the Value is constant. </td> </tr> <tr> <td data-bbox="480 1655 810 1818"> Offset Value </td> <td data-bbox="810 1655 1423 1818"> Enter the number of days or months by which you want to offset the start date of the data roll-up. </td> </tr> </tbody> </table>	Field	Description	Data Source	The source of the data you want to roll-up is the Order Line Item or a child filter for which the value you define must be the Order Line Item .	Field	The field is the parameter that determines the period for which you want to generate the data roll-up. Select from one of the following options. <ul style="list-style-type: none"> • Created Date • Effective Date • Expiration Date • Last Modified Date • Last Referenced Date • Last Viewed Date • System Modstamp 	Offset Type	Offset values that you define determine the start date of the period for which you are creating a data roll-up. Select from one of the following options. <ul style="list-style-type: none"> • Offset (+) Days • Offset (-) Days • Offset (+) Months • Offset (-) Months By default, the Value is constant.	Offset Value	Enter the number of days or months by which you want to offset the start date of the data roll-up.
Field	Description										
Data Source	The source of the data you want to roll-up is the Order Line Item or a child filter for which the value you define must be the Order Line Item .										
Field	The field is the parameter that determines the period for which you want to generate the data roll-up. Select from one of the following options. <ul style="list-style-type: none"> • Created Date • Effective Date • Expiration Date • Last Modified Date • Last Referenced Date • Last Viewed Date • System Modstamp 										
Offset Type	Offset values that you define determine the start date of the period for which you are creating a data roll-up. Select from one of the following options. <ul style="list-style-type: none"> • Offset (+) Days • Offset (-) Days • Offset (+) Months • Offset (-) Months By default, the Value is constant.										
Offset Value	Enter the number of days or months by which you want to offset the start date of the data roll-up.										

Rollup End Date Type	<p>If you select <i>Constant</i>, only the Rollup End Date is visible. Enter an end date for the rollup.</p> <p>If you select <i>Reference Value Source</i>, the following fields are visible. Enter values for those fields.</p>	
	Field	Description
	Data Source	The source of the data you want to roll-up is the Order Line Item or a child filter for which the value you define must be the Order Line Item .
	Field	<p>Select from one of the following options.</p> <ul style="list-style-type: none"> • Created Date • Effective Date • Expiration Date • Last Modified Date • Last Referenced Date • Last Viewed Date • System Modstamp
	Offset Type	<p>Offset values that you define determine the end date of the period for which you are creating a data roll-up.</p> <p>Select from one of the following options.</p> <ul style="list-style-type: none"> • Offset (+) Days • Offset (-) Days • Offset (+) Months • Offset (-) Months <p>By default, the Value is constant.</p>
	Offset Value	Enter the number of days or months by which you want to offset the end date of the data roll-up.

7. In the **Rollup Group By Parameters** section, enter values for the fields described in the following table.

Field	Description
-------	-------------

Group by Parameter	This parameter defines how you will categorize information from the data source in your data roll-up. Lookup and search the field that you want to select.
Related field on Rollup Data	Lookup and search the related field that you want to select for your data roll-up.

8. In the **Scope** section, enter values for the fields described in the following table.

Field	Description
Note: To include the following fields in the scope of your data roll-up, select the Include Radio button.	
Product Family	Lookup and search for the product families that you want to include or exclude from the scope of your data roll-up.
Products	Lookup and search for the products that you want to include or exclude from the scope of your data roll-up.
Region	Lookup and search for the regions that you want to include or exclude from the scope of your data roll-up.
Country	Lookup and search for the countries that you want to include or exclude from the scope of your data roll-up.
Account Type	Lookup and search for the Account Types that you want to include or exclude from the scope of your data roll-up.

9. In the **Inclusion Criteria** section, enter values for the fields described in the following table.

Field	Description
Field	Select an option from this list of fields to which the promotion must be applied. The fields available depend on what Reference Data Source you selected while defining the information .

<p>Operator</p>	<p>If the field you defined is a pick-list or a lookup field, you can select one of the following operators.</p> <ul style="list-style-type: none"> • equal to • not equal to • in • not in <p>For any other field you defined, select one of the following operators.</p> <ul style="list-style-type: none"> • equal to • not equal to • less than • less than or equal to • greater than • greater than or equal to • contains (displayed only if you selected a field of type text or area such as Description)
<p>Value Type</p>	<p>If you select <i>Constant</i> (default), only Value is displayed.</p> <p>If you select <i>Field Value</i>, Data Source and Field are displayed.</p> <p>If the field you selected is date, you can select from one of the following options:</p> <ul style="list-style-type: none"> • Offset (+) Days • Offset (-) Days • Offset (+) Months • Offset (-) Months
<p>Value</p>	<p>Enter a simple constant value or select single or multiple values using search widget depending on the field type and operator you defined for the primary data source.</p> <p>If you selected <i>Product</i> from the Field drop-down, you can search a product by its name or code in the Value field.</p>
<p>Data Source</p>	<p>Select one from the list of Search Filter CPQ data sources linked to Line Item you selected as the primary data source. With this data source, you can use the information from child objects to create evaluation criteria that can be based on previous purchase history such as order or asset line items, or roll-up data.</p>
<p>Field</p>	<p>Select one from the list of fields from the child filter object.</p>

Criteria Expression	Apttus Incentive Management populates this field when you enter values for the fields that defines the scope.
----------------------------	---------------------------------------------------------------------------------------------------------------

10. Click **Save**.

Defining Promotions

Every promotion you create has the following aspects that you must define:

- Promotion Information
- Promotion Scope
- Promotion Criteria
- Promotion Benefits
- Promotion Limits

Each aspect of a promotion is dependent on certain objects and fields that you must configure or define before you can create your first promotion. You must complete the [prerequisite](#) tasks before creating your first promotion plan.

Defining the Information of a Promotion

The screenshot shows the 'New Promotion' form in a 'Draft' state. The 'Information' tab is active, and the 'Information' section is highlighted in the left sidebar. The form contains the following fields and values:

- Promotion Name:** Apttus Incentive
- Promotion Type:** Buy X Get X
- Promotion Code:** PROMO1
- Auto apply?:** Yes
- Effective Date:** 11/15/2017
- Expiration Date:** 11/14/2018
- Promotion Group:** --None--
- Combine with Other Promotion?:** No
- Active:** Yes
- Description:** Apply this promotion for customers who purchase a minimum of 10 products.

At the bottom right of the form, there are three buttons: 'Close', 'Save', and 'Save & Continue'.

To define a new promotion,

1. Go to the Salesforce App Menu and select **Apttus Incentive Setup**.
2. Click **Incentives > New**.
3. On the Incentives information page, define values for the fields described in the following table.

Field	Description
Promotion Name	User-specific name for the promotion. This name is displayed to the user at any place the promotion information is displayed. For example, whenever a user looks-up the promotion information applicable to a specific product, the promotion name you provide here is displayed.
Promotion Type	<p>Different types of promotions. Supported types are:</p> <ul style="list-style-type: none"> • Buy X Get X • Buy X Get Y • For Every X Get X • For Every X Get Y • Own Every X Get Y <p>To configure what options to be displayed in this drop-down, go to Setup > App Setup > Create > Objects > Incentive > Application Method (API name: Apptus_Config2__ApplicationMethod__c) > Values section.</p>
Reference Data Source	<p>You can apply promotions on line item and on order levels. Select from the following options:</p> <ul style="list-style-type: none"> • Line Item: To apply a promotion on line item level. This line item is the primary object to which your promotion is applied. • Summary Group: To apply promotion on the order level. Note: For Summary Group, the promotion type is Buy X get X only.
Promotion Code	This is the code that is used for applying promotion. This code is captured on the order or proposal line items when a promotion is applied to the line item. This can also be used by the marketing team for marketing campaigns. When a promotion is not auto-applied, that is when the Auto Apply? checkbox is cleared, the user can use the incentive code to avail a promotional offer.
Auto Apply?	Can be set to Yes or No. Set it to <i>Yes</i> when you want a promotion to be automatically applied when a promotion criteria is met. Set it to <i>No</i> when you want the user to manually enter an Incentive Code to apply promotions.
Effective Date	Date from which the promotion is applicable. Cannot be blank. By default, it is set to current date (date when you create the promotion record).
Expiration Date	Date on which the promotion expires. Can be blank. Needs to be greater than Start Date. By default, it is set to 1 year from the Effective Date.

Field	Description
Promotion Group	This is a generic grouping of the Incentives for analyzing and tracking the incentives. The user can select a promotion group for each promotion. The list of Promotion Groups needs to be defined separately in the Incentive Group object and should be active. Marketing managers can create reports and track the incentive groups that are more successful than others and drive the business strategy accordingly.
Combine with Other Promotion?	Enables you to combine the new promotion with an existing promotion.
Active?	Can be set to <i>Yes</i> or <i>No</i> . Set it to <i>Yes</i> when you want a promotion to be applied and active for the criteria you specify. Active flag on the promotions will be set using a workflow linked to approvals similar to what you would do for any other custom object approval. For example, you can write a workflow rule to set the active status to true once the promotion is Approved (if approval is set up). Approvals set up would be similar to custom object approvals for any object.
Description	User-entered description for the promotion.

4. Click **Save** to save the changes or click **Save & Continue** to move to the next tab.

After you have described the promotion, you must now [define the scope](#) of this new promotion.

Defining the Scope of a Promotion

You must define the scope of a promotion to determine the types of accounts, the regions, and the products that this promotion will be available to.

To define the scope of your new promotion,

1. On the left side work pane, click **Scope**.
2. Define values for the fields described in the following table.

Note

The default value for each field is **All**. If you do not select a value, CPQ performs evaluation on all items for each field and that can impact the performance.

By default, the fields you define are set to be included in the scope of your promotion. Select the **Exclude** radio button for any parameter if you want to exclude that specific object from the scope of your promotion.

Field	Description
Price List	Select the price list that you want to use for your promotion.
Product Family	Select the Product Family that you want to apply the promotion to.

Field	Description
Product	<p>Select the specific products that you want to apply the promotion to. You can search a product by its name or code.</p> <p>If you selected Promotion Type as <i>Buy X Get X</i> on the Information page, you will see the following options:</p> <ul style="list-style-type: none"> • Include (OR): CPQ applies promotion on all products (in scope), which are available in the cart. • Include (AND): CPQ applies promotion on all products (in scope) only if the products are added to the cart. • Include Bundle Options (AND): CPQ applies promotion to a bundle and options only if the bundle is configured with specified options. • Exclude: The promotion will not be applied to the products specified. <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> To see these options on the UI, you must update Setup > App Setup > Create > Objects > Price Rule object > Product Criteria Oper field.</p> <ul style="list-style-type: none"> • To use Include (OR) scope, update the Product Criteria Oper field as "in". • To use Include (AND) scope, update the Product Criteria Oper field as "all". • To use Include Bundle Option (AND) scope, update the Product Criteria Oper field as "all in bundle". </div> <p>If you selected Promotion Type as <i>Buy X Get Y</i> on the Information page, you will see the following options:</p> <ul style="list-style-type: none"> • Include (OR): If one of the specified products is included in the cart, CPQ applies the promotion to the benefit product. • Include (AND): If all specified products are included in the cart, CPQ applies the promotion to the benefit product. • Include Bundle Options (AND): If the bundle and all specified option products are included in the cart, CPQ applies the promotion to the benefit product.

Field	Description
	<ul style="list-style-type: none"> • Exclude: CPQ does not apply the promotion to the products specified.
Region	Select geographical regions of the customers that you want to make this promotion available to.
Product Group	Select the Product Group that you want to apply the promotion to.
Country	Select countries where you want to make this promotion available.
Account Type	Select the types of accounts for which you want to make this promotion available.
Accounts	Select the accounts for which you want to make this promotion available.

3. Click **Save** to save the changes or click **Save & Continue** to move to the next tab.

After the scope, you must now [define the criteria](#) for this promotion.

Defining the Criteria of a Promotion

You must define the criteria for the promotion before you are ready to make it available to customers. If a sales representative wants to apply this promotion to a customer's purchase, the criteria you define here will determine if that purchase qualifies for the promotion.

You can define two types of criteria,

1. based on any the past purchases of customers or rolled up metrics of past purchases.
2. based on data from the line item, header, lookup objects, and child objects of the lookup objects for a quote or an order.

You can also define additional filter criteria to determine which products this promotion is applicable for.

To define the scope of your new promotion,

1. On the left side work pane, click **Criteria**.
2. Define values for the fields described in the following table.

Field	Description
Field	Select an option from this list of fields to which the promotion must be applied. The fields available depend on what Reference Data Source you selected while defining the information .
Operator	<p>If the field you defined is a pick-list or a lookup field, you can select one of the following operators.</p> <ul style="list-style-type: none"> • equal to • not equal to • in • not in <p>For any other field you defined, select one of the following operators.</p> <ul style="list-style-type: none"> • equal to • not equal to • less than • less than or equal to • greater than • greater than or equal to • contains (displayed only if you selected a field of type text or area such as Description)

Field	Description
Value Type	<p>If you select <i>Constant</i> (default), only Value is displayed.</p> <p>If you select <i>Field Value</i>, Data Source and Field are displayed.</p> <p>If the field you selected is date, you can select from one of the following options:</p> <ul style="list-style-type: none"> • Offset (+) Days • Offset (-) Days • Offset (+) Months • Offset (-) Months
Value	<p>This field is visible only if you select <i>Constant</i> from the Value Type drop-down.</p> <p>Enter a simple constant value or select single or multiple values using search widget depending on the field type and operator you defined for the primary data source.</p> <p>If you selected <i>Product</i> from the Field drop-down, you can search a product by its name or code in the Value field.</p>
Data Source	<p>This field is visible only if you select <i>Field Value</i> from the Value Type drop-down.</p> <p>Select one from the list of Search Filter CPQ data sources linked to Line Item you selected as the primary data source. With this data source, you can use the information from child objects to create evaluation criteria that can be based on previous purchase history such as order or asset line items, or roll-up data.</p>
Field	<p>This field is visible only if you select <i>Field Value</i> from the Value Type drop-down.</p> <p>Select one from the list of fields from the child filter object.</p>

3. Click **Save** to save the changes or click **Save & Continue** to move to the next tab.

You must now [define the benefits](#) of this promotion.

Defining the Benefits of a Promotion

To define the benefits of a promotion,

1. On the left side work pane, click **Benefits**.
2. From the **Benefits** section, enter the following details:

i The **Rule Name**, **Product Family**, and **Product** fields in the Benefits section are available only if you selected the *Buy X Get Y* promotion.

- a. In the **Rule Name** field, enter a name for the benefit rule.
- b. From the **Product Family** lookup, search and select the required product families.
- c. From the **Product** lookup, search and select the required products. Use the following operators to define the benefit for multiple products:
 - **In**: CPQ applies promotion to any and all products defined in the benefit criteria.

i If you selected **Include (OR)** in the Scope and select the **In** operator in Benefit, CPQ applies the promotion multiple times, once for each scope product. For example, if there are two scope products, CPQ applies the promotion twice to the benefit products, once for each scope product.

- **Or**: CPQ applies promotion only to the first product that matches the criteria.
- **And**: CPQ applies promotion to all products on the benefit criteria. All benefit products must exist on the cart to apply the promotion.

3. From the **Rate Type** drop-down, select a value.

Rate Type	Description
Single Rate	<p>Selecting this option allows you to define lump sum benefits which do not depend on transaction volume or amount. This is an ideal option when your promotion is not dependent on the amount or quantity of the line items. Select this value if your promotion calculation has no dependency on the amount or quantity ordered.</p> <p>Example, a seasonal promotion that offers 15% off for smartphones.</p> <p>If you select this Rate Type, enter the following values:</p>

Rate Type	Description			
	<table border="1"> <thead> <tr> <th data-bbox="421 311 790 374">Field</th> <th data-bbox="799 311 1431 374">Description</th> </tr> </thead> </table>	Field	Description	
Field	Description			
	<p>Rate Value Type</p>	<p>Select a value to define how you want to apply the benefit. The supported values are:</p> <ul style="list-style-type: none"> • % Discount: A percentage discount specified in the Adjustment Amount field is applied on the option selected in Adjustment Applies To. • Discount Amount: A discount amount specified in the Adjustment Amount field is applied on the option selected in Adjustment Applies To. • % Markup: A percentage markup specified in the Adjustment Amount field is applied on the option selected in Adjustment Applies To. For example, if you want to increase the price of laptops during the month of September, you can apply a percentage markup that adds to the List price. • Markup Amount: A markup amount specified in the Adjustment Amount field is applied on the option selected in Adjustment Applies To. For example, if you want to increase the price of laptops during the month of September, you can apply a markup amount that adds to the List price. • Price Override: The amount specified in the Adjustment Amount field is overrides the option selected in Adjustment Applies To. 		
	<p>Adjustment Applies To</p>	<p>The value of this field controls to which price point the adjustments are applied. For example, whether the price discounts are applied to the total net price or the starting price.</p>		

Rate Type	Description											
	<table border="1"> <thead> <tr> <th data-bbox="421 311 798 374">Field</th> <th data-bbox="802 311 1436 374">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="421 380 798 443">Adjustment Amount</td> <td data-bbox="802 380 1436 443">Enter the adjustment amount.</td> </tr> <tr> <td data-bbox="421 450 798 555">Benefit Uom</td> <td data-bbox="802 450 1436 555">Select the benefit unit of measure for the product.</td> </tr> </tbody> </table>	Field	Description	Adjustment Amount	Enter the adjustment amount.	Benefit Uom	Select the benefit unit of measure for the product.					
Field	Description											
Adjustment Amount	Enter the adjustment amount.											
Benefit Uom	Select the benefit unit of measure for the product.											
<p>Rate Table - No Tiers</p> <p>Allows you to conditionally define promotional amount. Examples of conditions are products, regions, account types.</p> <p>If you select this Rate Type, enter the following values:</p>	<table border="1"> <thead> <tr> <th data-bbox="421 734 839 804">Field</th> <th data-bbox="844 734 1436 804">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="421 810 839 916">Benefit Uom</td> <td data-bbox="844 810 1436 916">Select the benefit unit of measure for the product.</td> </tr> <tr> <td data-bbox="421 922 839 1144">Adjustment Applies To</td> <td data-bbox="844 922 1436 1144">The value of this field controls to which price point the adjustments are applied. Rate Type	Description	
	Field	Description
	Benefit Uom	Select the benefit unit of measure for the product.
	Metric Calculation Period	Select a period over which the tier metric is aggregated. The supported value is <i>No Rollup</i> , which means the tier metric is based on the value from individual transaction only.
	Metric Value Source	<p>The value from this field determines the source based on which the volume or revenue is calculated. The calculated volume or revenue amount is used to determine the tier.</p> <p>Select this value if the Tier Metric Type is Volume. Once Quantity is selected, you will see that in the Rate Table Structure, the "from" and "to" columns become "From Quantity" and "To Quantity".</p>
	Adjustment Applies To	The value of this field controls to which price point the adjustments are applied. For example, whether the price discounts are applied to the total net price or the starting price.
	Rate Table Columns	<p>This field is used to define the conditions to be used with the rate table.</p> <p>If you need to define different promotions for different products, make sure the product column is added. If you would like to add another condition, make sure to select the value from the picklist and click the Generate button.</p>

4. Click **Save** to save the changes or click **Save & Continue** to move to the next tab.

With the basic information, scope, criteria, and benefits defined, you must now [define the limits](#) of this promotion.

Defining the Limits of a Promotion

You must define promotion limits to determine the number of times you customer can apply a promotion for different types of the transactions.

To define the limit of a promotion,

1. On the left work pane, click **Limits**.
2. Click **Add** to add a new limit and **Delete** to delete a limit.
3. Enter values for the fields described in the following table:

Field Name	Description
To Whom Does the Limit Apply?	Enables you specify the object on which the limit is applied. The objects on which limit is applicable on are <i>Account</i> , <i>User</i> , and <i>Contact</i> .
Limit Metric	Specifies what will be the parameter on which the limit is applicable. <i>Benefit Quantity</i> : Specifies that the discount would be applied on a fixed quantity.
Max Limit Value Type	Specifies whether a limit would be a constant value or derived from some formula field.
Limit Value	Specifies the value of the Limit Metric. For example, if you specify the limit value as 10 and the limit metric as Benefit Quantity, the user can use the same promo code when the Quantity of the product is 10.

Field Name	Description
Recurrence Type	Specifies whether the limit applied is one time or on a recurring basis.
Recurrence Frequency	Specifies the frequency at which the applied incentives are limited. Available frequencies are <i>Monthly, Quarterly, Half Yearly, Yearly, Order</i> .

- Click **Save** to save the changes or click **Save & Continue** to move to the next tab.

Multiple promotion Limits

- A given promotion can have more than one limits and all these limits needs to be enforced for the promotions. E.g. Promotion limits on a single promotion can be as follows.

Promotion Limit Parameters

- Overall Promotion Limit - Across customers
 - Irrespective of duration - Total number of promotions applied across customers.
 - By specific duration - Total number of promotions applied across customers during a given period.
- Limit by Customer
 - Irrespective of duration - Total number of promotions applied for a given customer.
 - By specific duration - Total number of promotions applied for a given customer during a given period.
- Limit by Customer and Product
 - Irrespective of duration - Total number of promotions applied for a given customer and product.
 - By specific duration - Total number of promotions applied for a given customer and product during a given period.
- Order level Limits: This means that customer can only use certain number of promotions within a given order.
 - By promotion
 - By required purchase product level
 - Order level promotion limits can be dynamically applied and does not need to be tracked separately. However, account level and promotion level needs to be tracked.

For example, all the eligible doctors within a DSO (Days Sales Outstanding) will receive 1 case (Invisalign Teen, Full or Assist) priced at \$990, if that case is submitted within 90 days of their re-engagement training. Else, they are not eligible for receiving cases worth \$990.

Expected Behavior

Options Selected	Expected behavior
Auto Apply deselected, Combine with Other incentives selected	You can build a User Interface to display the “Show Available Promotions” list using the Promotions API, which displays non-auto applied promotions. The user can then select one or multiple promotions to be applied.
Auto Apply deselected, combine with other incentives deselected	If a user provides multiple promo codes as a comma-separated list, the highest priority promotion is selected and applied from the list of promotions provided in the comma-separated list.
Auto-Apply selected, combine with other incentives deselected	If two or more promotions are applicable, the system picks the promotion with the highest priority and applies it.
Auto-apply selected, combine with other incentives selected	<p>All promo codes fulfilling the criteria will be applied. If one or more promo codes have priority 1 which is applicable in a scenario all the promotions are applied. Suppose for a given scenario there are 4 promo codes which are applicable having priority 1,1,2,2 all four are applied.</p> <p>Pricing is not stacked, so if all the four qualify and allow others to be applied then all four are applied.</p> <p>If some of the promotions do not allow others to be applied then those promotions are filtered out.</p>

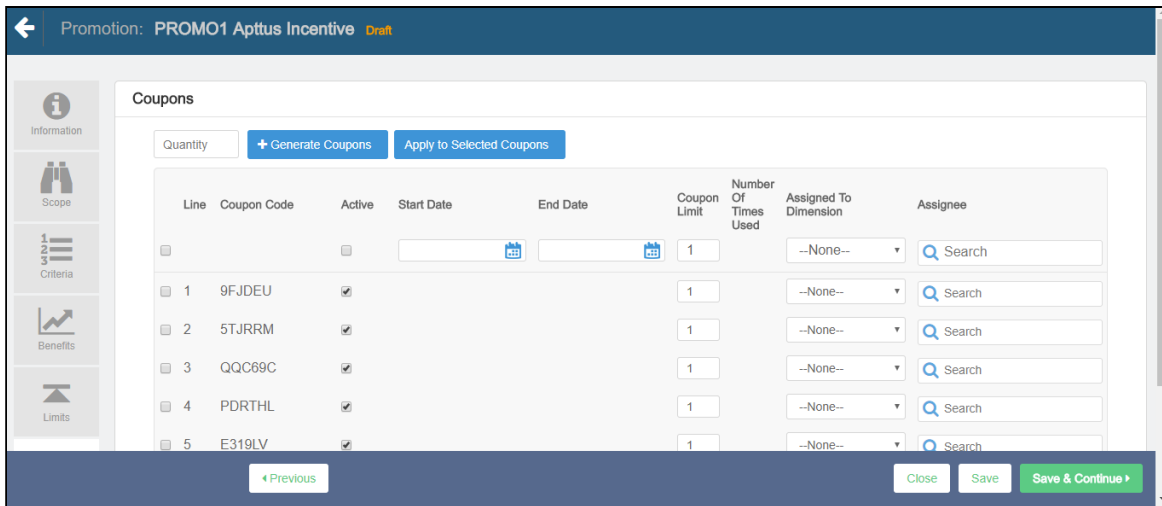

After defining promotions, ensure that you run **Criteria Maintenance > Update Pricing Fields** to apply the defined promotions.

Generating Coupons for a Promotion

Coupons are generally alphanumeric codes that correspond to a promotion. With Apttus Promotions Management, you can now create multiple coupon codes for potential customers to promote your business and specific products in your inventory.

After you identify potential end customers in a target market, you can use coupons to track how customers use incentives, how you can optimize your promotions, and how you can re-target your customers. You can generate multiple coupon codes to share the range with your marketing team.

i You can generate coupons only if you defined **Auto apply?** = **No** on the Information page. If **Auto apply?** = **Yes**, the **Generate Coupons** button is disabled.

To generate coupon codes for a promotion that you have created,

1. On the left work pane, click **Coupons**.
2. In the **Quantity** field, enter the number of coupons you want to generate and click **Generate Coupons**.
3. Enter values for the fields described in the following table:

i These fields act as filter criteria as well. For example, the coupon assign-to account or user needs to match the account field value that is specified on the quote or the logged-in user respectively. If the Account field value on the quote is missing, the coupon assign-to account needs to match the account linked to the opportunity.

Field	Description
Active	Select the checkbox to activate the coupon.
Start Date	The start date for the coupon.
End Date	The last date this coupon is valid.
Coupon Limit	The number of times you can use this coupon.

Field	Description
Assigned To Dimension	The level at which the coupon is valid. Select from one of the following options. <ul style="list-style-type: none"> • Incentive User • Account
Assignee	Select the user or account to which the coupon is applicable.

- Click **Save** to save the changes or click **Save & Continue** to move to the next tab.

 After coupons are generated for a promotion, the Apply Promotions dialog does not list the promotion. The user must enter the coupon code to apply coupons instead.

- Select specific coupons in the list and click **Apply to Selected Coupons**. You can also mass edit coupons by selecting the checkbox at the header and clicking **Apply to Selected Coupons**.
- To create multiple coupons for one incentive, use the following sample code:

```
List<IncentiveCoupon__c> coupons =
IncentiveCouponFactory.createSObjectsForIncentive(incentiveS0.Id, 5);
System.assertEquals(coupons.size(), 5);
for (IncentiveCoupon__c couponS0 : coupons) {
    System.debug('couponCode=' + couponS0.CouponCode__c);
}
```

You can view the resulting list of coupons on the Accounts page.

Coupons Coupons Help ?								
Action	Coupon Id	Coupon Code	Assigned To	Assigned To Type	Effective Date	Expiration Date	Status	Active
Edit Del	CO-000001	ER42H1					Draft	<input type="checkbox"/>
Edit Del	CO-000002	K4JZ9Y					Draft	<input type="checkbox"/>
Edit Del	CO-000003	MZKOVJ					Draft	<input type="checkbox"/>
Edit Del	CO-000004	IH3NYP					Draft	<input type="checkbox"/>
Edit Del	CO-000005	CSLG86					Draft	<input type="checkbox"/>

 The Coupon Code is displayed in the product details page. If there are multiple coupons, all coupons codes are saved as comma separated.

Viewing the Summary of a Promotion

After you have configured the promotion record, you can use the Summary tab to view all the details. Something similar to the image below is displayed when you click Summary tab.

Inclusion Criteria
(Quantity = 10) AND (Net Price = 20000)

Rate Type: Rate Table - No Tiers Adjustment Applies To: Base Price

Rate Table

Quantity	Rate Value Type	Adjustment Amount
5	Discount Amount	100.00000
10	Discount Amount	200.00000

Delete Clone Close

Adding Custom Fields to the Promotion Information Page

You can now add to the details that you want to capture on the Promotion Information page. You can include more fields such as check boxes, number, dates, texts, currency, pick lists, multi-pick lists, and other fields that Salesforce supports.

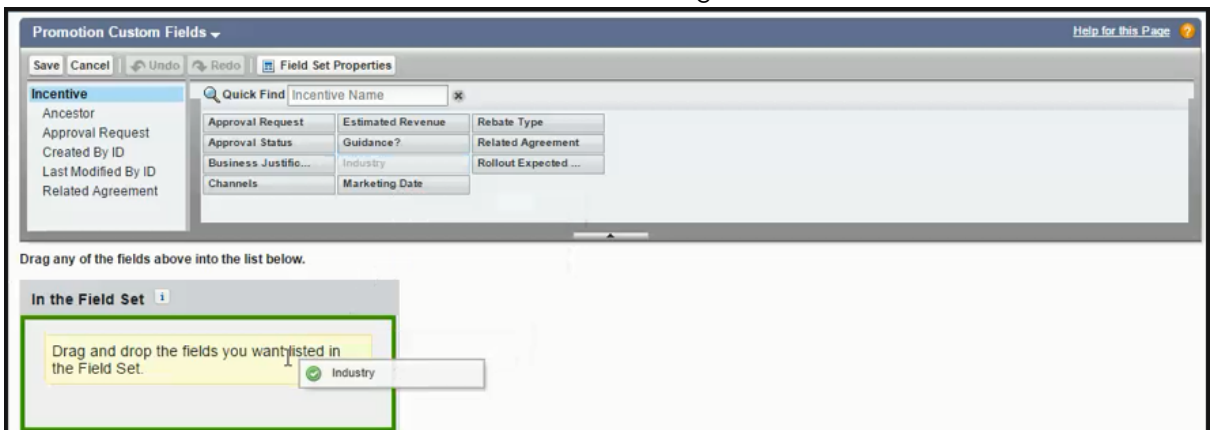

For example, you want to include a field to capture the industry for which you are rolling out this specific promotion. You can add such a custom field on the Promotion Information page.

To add a custom field on the Promotion Information page

1. Add a custom field for the Incentive object. Let's call this field **Industry**, which is a pick list from which users can select a relevant option.

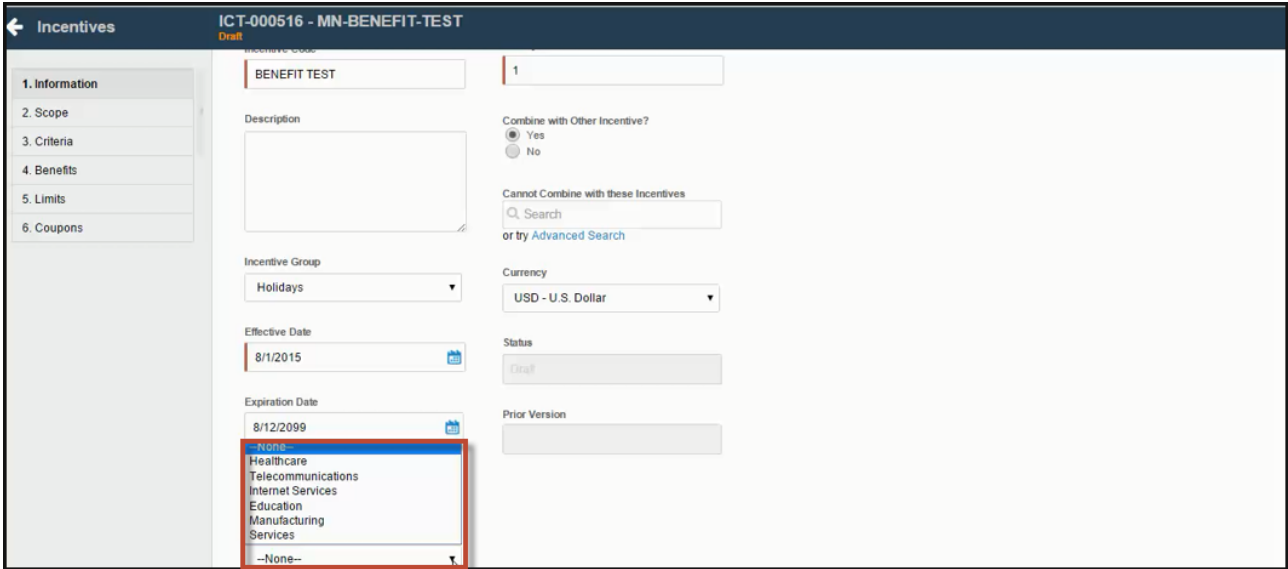

2. Add the pick list options you want to include. For example,
 - Healthcare
 - Industry
 - Manufacturing
 - Services
 - Telecommunication
 - Others
3. Now Edit the Incentive Field set to add the Industry field.

4. Click **Save**.

You have successfully added the Industry pick list to the Promotion Information page.

Configuring the Apply Promotion Window

The **Apply Promotion** window is displayed on the cart when the Sales Rep clicks **Apply Promotions** on the line items or the cart. You can configure the fields displayed on the window in the Config Settings.

To configure the Apply Promotion Window

1. Go to **All Tabs > Config Settings > Display Column Settings**.
2. From the **Display Type** drop-down, select **Apply Promotions**.
3. Select the flow you want to configure in **Flow**.
4. You can edit the existing fields or add new fields to the window. To add a new field click add icon(**+**).
5. The following fields are available to you:

Field	Description
Incentive Code	Displays the code of the incentive on the window
Incentive Name	Displays the name of the incentive on the window
Sequence	Displays the sequence of the incentive.
Expiration Date	Displays the date of the expiration of the incentive.

Field	Description
Description	Displays the description of the incentive that you added while creating the incentive.
Combine with Other Promotions	Indicates whether the promotion can be combined with other promotions.

The fields **Incentive Code**, **Incentive Name**, **Sequence**, and **Expiration Date** are displayed by default.

6. Click **Save**.

Use Case: Configuring a Promotion for the Total Price on the Cart

This use case describes how to configure a promotion on an order level. You can configure a promotion such that the user gets a discount of 10% if the total price of the cart is greater than 500\$.

This section provides an overview of how to configure promotion for the use case and list high-level steps of configuring the promotion for an order. For detailed steps about configuring a promotion, refer to [Configuring Promotions](#).

Before you begin

Understand Promotions. Refer to [Managing Promotions](#).

To Configure a Promotion for an order

1. Go to the Salesforce App Menu and select **Apttus Incentive Setup**.
2. Click **Incentives > New**.
3. On the Incentives information page, define values for the fields as described in [Defining Promotions](#) and **Save**. Ensure that you select **Summary Group** in the **Reference Data Source** Field.
4. In the **Criteria** tab, enter the line on which the promotion is applied. Select the following:
 - **Field:** Totals
 - **Operator:** Greater Than

- **Value Type:** Constant
- **Value:** 500

 You can also use Field as **Line Type** that has pre-populated values such as Total, Subtotal, Group Total, Category Total and Adjustment to configure the promotions for this use case.

5. In the **Benefits** tab, enter the following information:
 - a. **Rate Type:** Single Rate
 - b. **Rate Value Type:** % Discount
 - c. **Adjustment Applies to:** Total price
 - d. **Adjustment Amount:** 10

Result:

Click **Apply Promotions** on the Cart. The discount is visible on the Total Price.

Applying Promotions for eCommerce Orders

You can apply the promotions that you define, for orders placed on Apttus eCommerce, using APIs.

The following table lists such APIs.

API	Description
getIncentivesForCart	To get a list of Incentives of type PULL (Auto Apply = False) for a given Cart for an order.
updatePriceForCart	To apply one or more PULL promotions, set the comma separated list of PULL promotion codes (Incentive codes) on the Product Configuration object in the field "Apttus_Config2__CouponCodes__c". After setting the values, reprice the cart using the "updatePriceForCart" API. CPQ will auto-evaluate all promotions of type PUSH (auto Apply = True) and will apply qualified promotions as part of the pricing.

API	Description
applyIncentiveLimit	API to apply commit incentive limit from work-in-progress orders to the final limit data. Ideally, this API will be called when the order is accepted or confirmed by the customer. However, individual implementations can decide when to call this API.

Analyzing Promotions

For analysis purpose, Apttus CPQ and Promotions Management captures the information of the applied promotions at the line item level in the promotions code and promotion benefit. As a Marketing Manager, once the promotions are applied on the sold products, you can perform different types of analysis by creating reports and dashboards for the applied promotions and forecast your business revenue.

The different promotions applied on your cart and the ones which are pending to be applied on the cart are captured in the form of **Incentive Limit Data**. This also helps in knowing limit details, such as Limit Start Date, Limit End Date, Limit Value and more.

Incentive Groups club all the incentives together under a single row, based on your business requirement, and help you analyse how the incentives applied from a certain Incentive Group are helpful in growing your business.

In case of multiple benefits applied on a single product or cart, the system captures the details of each benefit applied through a promotion in the Adjustment Line Items or Order Adjustment Line Items.

Managing Assets

Quote-to-Cash is the end to end business process between your customer's interest in a purchase and the revenue that your business realizes from that purchase.

The Quote-to-Cash flow includes creating a Sales Quote, submitting the quote, negotiating and managing the contract, fulfilling the order, tracking payment, and managing your customers' purchases.

In the Quote-to-Cash flow, Asset Management is a set of mission-critical business processes that you can employ to manage your customer's purchased products with a variety of billing models to ensure efficient collections and accounting.

The following table lists and describes industry challenges with Asset Management and the solutions that Apttus provides for each challenge.

Challenges with Asset Management	Apttus-provided solutions
<p>Asset Management can be a complex coordination of activities including custom design and configuration. Depending on your business requirements it could be,</p> <ul style="list-style-type: none"> • scheduling milestone-based manufacturing processes • software provisioning • equipment installation • scheduling services teams. <p>If customers update their orders, fulfillment becomes even harder to manage.</p>	<p>Asset Management is based on the order information that you have already defined in your sales quote and resulting contracts. Asset Management then, becomes very easy when you integrate Apttus CPQ with Apttus Contract Lifecycle Management (CLM).</p> <p>Historically, Assets have been managed using an Enterprise Resource Planning (ERP) application. Because it is important for you to capture on-the-fly changes to orders and integrate your Order Management processes with customer facing applications like Contract Management solutions, assets or purchased products are now also managed within a CRM system, or in multi-functional CPQ applications.</p>
<p>If a customer has multiple orders or changes, invoices must be coordinated so your customers do not receive multiple invoices.</p>	<p>Renewals, changes, swaps, terminations, and additions to an asset increase the complexity of invoices. You can use Asset Management to generate an accurate, up to date, and easy to understand invoice so your customers understand it easily, pay quickly, and have a positive experience.</p>

Challenges with Asset Management	Apttus-provided solutions
<p>Your finance team must analyze transaction and revenue information to devise the best revenue schedules that determine when revenue is recognized. Revenue recognition depends on when your customers receive their products, services and subscriptions.</p>	<p>Revenue recognition can be a challenge, but it's much easier when Finance can automatically generate the appropriate revenue schedules for products, services, and subscriptions based on contracts. With Apttus CPQ, you can verify if services are rendered or products delivered, and then see how those impact your customers' billing schedules and the overall revenue forecast.</p>

You can define the Asset Management functions with different data objects to track Quote and Contract details until an order is fulfilled. With Asset Management you can

- make it easy for customers to add more products and services
- align all product changes to your customer's bill cycle
- drive charge pro-rations and pro-ratio credits
- customize the renewal process that best suits your organizational needs

The following table lists the benefits Apttus Asset Management has over ERPs.

Challenges with ERPs	Solutions by Asset Management
<p>Do not understand recurring revenues or distinguish between monthly recurring revenues and annual recurring revenues.</p>	<p>Works with accounting solutions and meet the financial requirements unique to both one-time purchases and subscription businesses.</p>
<p>Do not handle pricing and packaging changes like upgrades, downgrades or increments.</p>	<p>Can quickly modify your pricing and packaging options irrespective of the number you increment or decrement.</p>
<p>Do not tell you how many active customers you have, or your rate of customer retention.</p>	<p>The reporting feature can detail your renewal rates and help you up-sell, cross-sell, and formulate strategies to increase customer retention.</p>
<p>Do not give you a unified view of how your business is doing.</p>	<p>Works seamlessly with Apttus CPQ, CLM, and Billing Management to bring awareness of information including renewal plans and usage statistics to every department in your organization.</p>

Whether it is a one-time order, a subscription, or a usage-based service you sell to your customers, you can use Asset Management to manage any purchased product or service for your customers.

Asset-Based Ordering functionality is now built into Apttus CPQ. With the Asset-Based Ordering functionality, you can service and manage existing orders based on your customers' requirements.

With ABO, you can perform transactions for Purchased Products using cloud-enabled systems that operate on a massive scale and real-time speed. With Asset-Based Ordering, you can perform complex functions such as suspensions, mid-cycle upgrades, downgrades, add-ons, and cancellations, all on a single, user-friendly interface.

With Asset-Based Ordering you can

- work seamlessly with CRMs to bring subscription awareness to your front office
- unify your commerce, billing, and finance processes so customer relationships take center stage
- increase recurring revenue that you earn from existing customers by retaining them with renewals, incentives, rebates, and promotions

Asset-based Ordering adds to the robust CPQ functionality and the larger Quote-to-Cash experience by giving you a quick return on your investment and quickly increasing both, revenue and customer base.

About Assets and Asset Line Items

Any product or service that your customers buy, become that customer's assets. While your organization may have a unique and customized Order Fulfillment process, all the processes and procedures in Apttus Asset Management start with the Line Item in an order.

The following image describes the life-cycle of a Line Item in the Quote-to-Cash flow.

After your customers agree to purchase a product, the product changes from a Proposal Line Item to an Order Line Item. The status of the Quote/Proposal in this stage is **Accepted** and the order is now ready to be invoiced.

After you receive payments for an order is when the order line item changes to an **Asset** line item.

As an Administrator, you must configure Apttus CPQ to enable Customer Service and Sales Representatives in your organization to be able to perform the following actions to manage assets.

1. Generate asset records from orders
2. Renew the term for an asset
3. Change the **Term, Quantity, Options, and Attributes** of a product
4. Cancel products and subscriptions
5. Swap one purchased product with another
6. Create quotes for new products and services based on assets
7. Create quotes to modify existing products and services
8. Get visibility into the asset life cycle during customer interactions

Before you start to define the mechanism that Customer Service and Sales Representatives must use to manage a customer's assets, you must understand how they use Asset-Based Ordering.

Asset-Based Ordering Packages Required

For implementing Asset-based Ordering, follow the instructions of installing a package from the Install Center explained in the Installing CPQ section. Ensure that you have installed the following packages in your environment. Always check the latest Release Notes to get the latest package versions.

For the Quote/Proposal Flow,

Order	Package	Install Center tab to access the package
1	Apttus Proposal Management	CPQ
2	Apttus Configuration & Pricing	CPQ
3	Apttus CPQ API	CPQ
4	Apttus Quote/Proposal-Configuration Integration Integrations	Integrations
5	Apttus Quote/Proposal-Asset Integration	Integrations

For the Contracts Flow,

Order	Package	Install Center tab to access the package
1	Apttus Contract Management	Contract Management
2	Apttus Quote/Proposal-Contract Integration	Integrations
3	Apttus Contract-Configuration Integration	Integrations

Configuring Asset-Based Ordering

As an administrator, you must enable Customer Service and Sales Representatives in your organization to **Change**, **Swap**, **Renew**, and **Terminate** a customer's assets. To this end, you must complete the following procedures in the listed order.

Mandatory Configuration

The following steps are the mandatory configuration steps which are required to implement ABO successfully.

1. [Granting appropriate access and permissions to Managers, partners, other administrators, Customer Service, and Sales Representatives](#)
2. [Configuring Flow Management Settings](#)
3. [Configuring Installed Products Settings](#)
4. [Configuring Asset Management Flows](#)
5. [Customizing Display Actions for the Installed Products page](#)
6. [Defining the look and feel of the Installed Products page](#)
7. [Configuring Asset-based Pricing](#)
8. [Configuring Lookup Field Settings](#)

Optional Configuration

The following configuration steps are optional. You may implement these steps based on your business requirements.

1. [Defining the Actions you want to allow for each Asset Line Item](#)
2. [About Integration of Assets with Contracts](#)
3. [Creating an Approval Workflow for **Renew**, **Change**, **Swap**, and **Terminate**](#)
4. [Configuring Mass Update for Assets](#)
5. [Creating a Replacement Rule to enable the Swap feature](#)
6. [Configuring the Custom Attributes Page](#)

The values you enter for the fields in the pages listed above will determine how Customer Service and Sales Reps in your organization manage a customer's assets.

About Asset Management Flows

Before you start configuring Asset-Based Ordering, you must understand how the Sales and Customer Service Representatives in your organization will use the ABO functionality.

Asset-based ordering is particularly useful when your business offers complex service products, such as phone services and equipment.

On the Installed Products page, you can Renew, Terminate, Swap, and Change an existing standalone, fixed, or a configurable bundle asset. For each transaction involving ABO actions, the system creates a new order while you are navigating on the Cart. The status of the Asset Line Item is not changed until you finalize the Cart and activate the Order containing that Asset Line Item.

Use case

For a sales-driven industry with products such as equipment (new purchase) and service (purchased for an equipment), you might want to achieve the following:

- As a manufacturing sales representative, for a service flow, you want to view the **Renew** and the **Terminate** button. For an equipment flow, you want to view the **Change** and the **Swap** button.
- As a subscription sales representative, you want to see the **Renew** button only when I make a purchase for a quote of type *renew*. For an add-on quote or an upgrade quote, you do not want to see the **Renew** button. For example, managing the renewal of a magazine subscription.

There are total 3 flows that you can consider before starting the configurations for using ABO. Ensure that you understand and choose one of the flows to implement error-free ABO.

1. **Quote/Proposal Flow:** This is one of the signature events in Asset-based Ordering involving Quote/Proposal. This is the normal flow of going through the Quote/Proposal to an Order and then to the Assets. Once you accept a Quote/Proposal, the Order is generated. Upon activation of the order, assets are created.
2. **CSR Flow:** This is the flow designed to enable the Sales Rep to skip the creation of a Quote/Proposal. No signature event, such as the creation of an Agreement or a Quote/Proposal is involved. A new button called **Asset Manager** is configured on the Accounts page to help the Sales Rep navigate directly to the Installed Products page.
3. **Contract Flow:** This is one of the signature events in Asset-based Ordering involving Contracts/Agreements. The assets are created through Contracts/Agreements using the normal Contract lifecycle flow. Once you finalize a Contract (containing Agreement Line Items), the corresponding Asset Line Items are created.

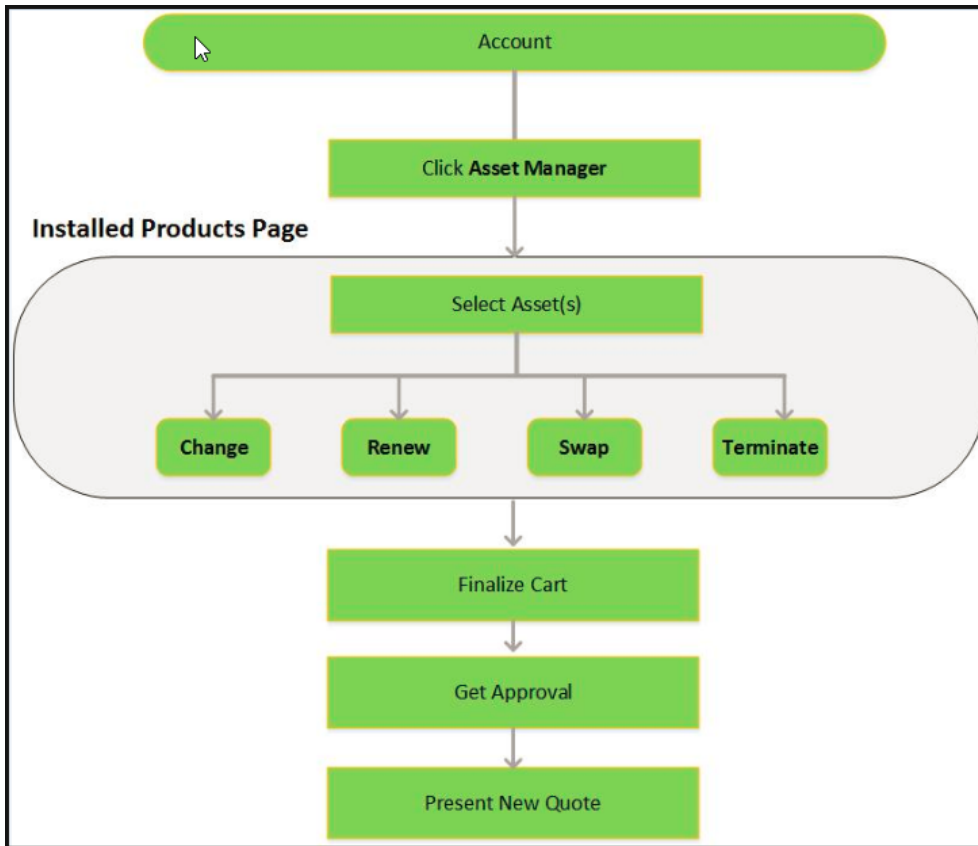

Quote/Proposal Flow

In this flow, the Sales Rep configures the Quote/Proposal and finalizes a configuration. Once the configuration is finalized, the Sales Rep presents the configuration to the customer. Upon acceptance from the customer, the Sales Rep clicks the **Accept** button on the Quote/Proposal. An order is created for this Quote/Proposal, which upon activation, creates the Asset Line Items with the *New* status. The Sales Rep can configure the Quote/Proposal again and navigate to the Installed Products page to view all the active assets. No custom triggers are required here.

CSR Flow

There can be scenarios when your Sales Rep does not want to configure the Quote/Proposal again to land on the Installed Products page. For these type of scenarios, you can configure the **Asset Manager** button on your Account page. Clicking **Asset Manager** creates an Order and navigates you directly to the Installed Products page. In this flow, you skip the navigation of going to the Installed Products page through the **Quote/Proposal > Configure Products**. You just have to configure a custom formula button to achieve this, explained here.

The following image illustrates the CSR flow from the Sales and Customer Service perspective.

Contract Flow

A contract contains Agreement Line Items, Asset Line Items or Order Line Items. In this flow, you follow the normal Contract Lifecycle flow of creating a Contract, presenting it to your customer and finalizing the Contract. Here, the Asset Line Items are created when the Sales Rep finalizes and activates a Contract. Apttus CPQ now provides the ability to synchronize the changes in Assets with the changes in a Contract. The changes you make inside a Contract (such as a change in Contract End Date) will be reflected in the Assets contained in that Contract. Similarly, when you perform actions on your purchased Assets (such as changing the Quantity of an Asset), these changes will be reflected in the Contract.

See [Configuring the Custom Settings for Asset Management Flow](#) to learn how to configure the above flows.

Configuring Asset Management Flows

For the different Asset Management Flows explained [here](#), you must configure different custom settings.

To enable the Quote/Proposal Flow

1. Go to **Setup > Build > Customize > Develop > Custom Settings > Proposal System Properties > Manage**.
2. Click **Edit** next to **System Properties**.
3. Search for **Auto Create Order** checkbox and select it. Refer [Proposal System Properties](#) for details.
4. Click **Save**.

To enable the CSR (Order) Flow

Asset Manager is a simple formula field that enables the creation of an order header which in turn is used as a container to manage a customer's assets without a proposal.

1. Click **Setup > Create > Objects**.
2. Select the **Account** object and go to the **Custom Fields & Relationships** related list.
3. Create a new formula field with the label **Asset Manager** and *Text* as **Return Type**.
4. In the advanced formula editor, enter the query string with the following parameters.

```
HYPERLINK("/apex/Apttus_Config2__AccountOrderCreate?id=" & Id &
"&method=csrFlow&flow=csrFlow&priceListId=<pricelistid>&launchState=assets&auto
Finalize=true&activateOrder=true&retId=" & Id , IMAGE("", "Asset Manager"), "_se
lf")
```

In the above formula, replace **<pricelistid>** with the *ID* of your desired Price List. For the flow parameter, specify the name of the Flow that you have defined in the [Flow Settings](#). To support this button across different Price Lists, you must create separate buttons for each Price List.

5. Click **Save**.

To enable the Contract Flow

1. Go to **Setup > Build > Customize > Develop > Custom Settings > Comply System Properties > Manage**.
2. Click **Edit** next to **System Properties**.
3. Search for **Auto Create Order** checkbox and select it. Refer *Comply System Properties* in [Configuring Custom Settings](#) for details.
4. Click **Save**.

⚠ We recommend you to refrain from enabling **Auto Activate Order** from **Comply System Properties** as well as **Proposal System Properties**, simultaneously.

For detailed information on the behavior of these two checkboxes, see [About Integration of Assets with Contracts](#).

Configuring Asset-based Pricing

The price loaded in an asset is based on the price mentioned in its Price List Item. As an administrator, you can decide if you want to retain the asset price or set the new base price in the further transactions on the Installed Products page. A workflow is used to set the the above actions for the asset pricing. If the **IsAssetPricing** field of the Line Item object is set to *True*, the system retains the price of the Asset Line Items for any future renewals or amendments.

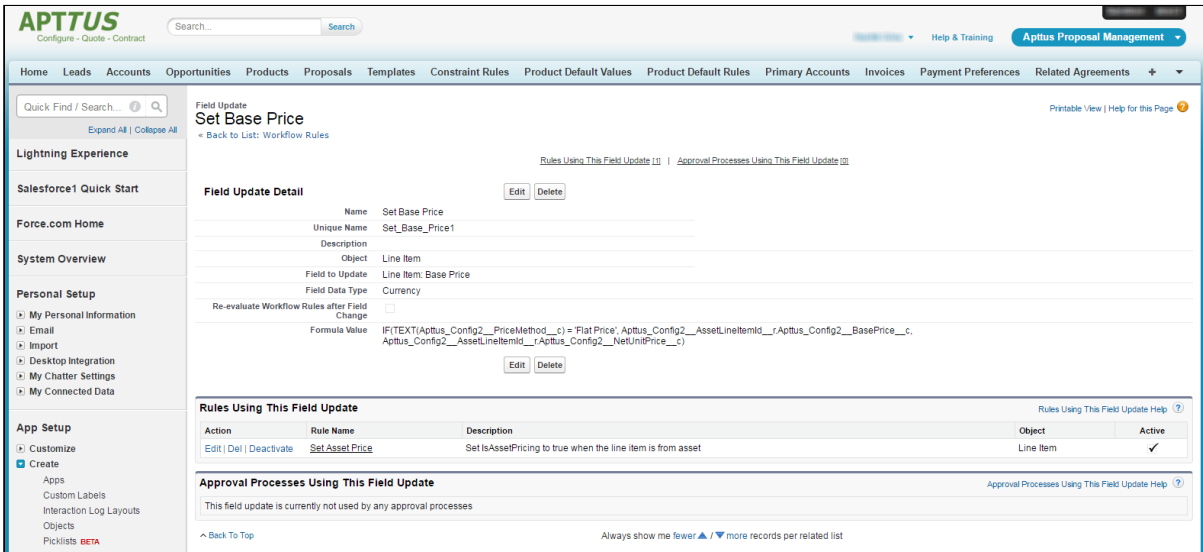

For example, the pricing for a cell phone plan has increased from \$20 to \$30 per month, and the Price List Item record is updated to reflect the new list price. However, the selling company has decided that customers who already have the product installed as an asset will not be charged the new price for renewals, amendments, etc. These customers shall be allowed to purchase the same subscription at the base price at which they purchased it originally.

You must create a Workflow Rule for the Line Item object, as described in the [Salesforce Documentation](#).

For the Workflow actions,

1. Set the **IsAssetPricing** check box to *True*.

2. Set the formula for Base Price (depending on your requirement).

Ensure that all the Options products of your Bundle follow the Asset Pricing if you have configured a Workflow Rule.

Configuring Asset-Based Pricing without Workflow Rules

Using a workflow rule to obtain the price of an asset during Asset-based operations has certain limitations. You could use workflow rules to fetch asset pricing on quantity and term updates but the process gets complicated when it involves attribute or other field changes.

Asset pricing without workflow rules helps you pick the selling price of an asset or its new price from the Price List item as and when needed.

With this feature, you can choose to

- Retain the asset price on the cart (default asset price)
- Go back to the Price List Item and fetch the new price of the asset. This happens when the parameters driving pricing undergo change.

Configuration

To turn ON Asset-based pricing without creating a workflow rule, you must configure the following two parameters:

- **Default Asset Pricing Indicator:** When checked, the system loads the asset price by default in the cart and monitors the changes done to fields added in the Asset Pricing Criteria.
Go to **Custom Settings > Config System Properties** to turn ON the pricing indicator.
- **Criteria Field Names:** Enter the API name of the field like Quantity or attribute that drives pricing.
Go to **Custom Settings > Config Asset Pricing Criteria Fields** to provide the field APIs. Any changes to the fields specified here will trigger the flip and you will see the price from PLI on the cart. If you revert the update, the price will change to the default asset price.

- If the default asset pricing indicator is off, then no asset pricing criteria should be defined.
- Asset pricing is always turned on if there asset pricing criteria defined.
- Asset pricing indicator is at a global level. Any requirements to turn it off on a selective basis must be handled through a workflow rule to deselect the indicator on the cart load.

Use Case 1

1. Create a product 'B' with tiered pricing. The per unit price of the product is \$1200.
2. Ensure **Default Asset Pricing Indicator** is set to True.
3. Create a Quote with one unit of product 'B' for 1200. Offer a discount of \$200 to see that the price of asset 'B' now becomes \$1000.
4. Navigate to **Setup > Develop > Custom Settings > Config Asset Pricing Criteria Fields**. The Config Asset Pricing Criteria Fields page is displayed.
5. Click **New**. The Config Asset Pricing Criteria Fields Edit page is displayed.
6. In the Name field, enter a name for the asset pricing criteria.
7. In the **Criteria Field Names**, enter Apttus_Config2__Quantity__c (API name of the **Quantity** field).
8. Keep the **Line Status** field blank.
9. From the CSR flow, select this asset 'B' and perform the ABO operation of **Change**. You will see the asset price of \$1000 on the cart.
10. Change the **Quantity** to '5' and you will see that asset price is now set to \$1200 (from the PLI).

✔ Use Case 2

1. Create a product 'B' with tiered pricing. The per unit price of the product is \$1200.
2. Ensure **Default Asset Pricing Indicator** is set to True.
3. Create a Quote with one unit of product 'B' for 1200. Offer a discount of \$200 to see that the price of asset 'B' now becomes \$1000.
4. Navigate to **Setup > Develop > Custom Settings > Config Asset Pricing Criteria Fields**. The Config Asset Pricing Criteria Fields page is displayed.
5. Click **New**. The Config Asset Pricing Criteria Fields Edit page is displayed.
6. In the Name field, enter a name for the asset pricing criteria.
7. In the **Criteria Field Names**, enter Apttus_Config2__Quantity__c (API name of the **Quantity** field).
8. In the **Line Status** field, enter Renewed.
9. From the CSR flow, select this asset 'B' and perform the ABO operation of **Change**. You will see the asset price of \$1000 on the cart.
10. Ensure that the line status changes to Renewed.
10. Change the **Quantity** to '5' and you will see that the asset price is still \$1000. The asset pricing criteria works for change in quantity, but the asset pricing criteria does not work for Renewed. Though you change quantity, you will still see the asset pricing.

Standalone Asset - Quantity Update

Similar to the above use-case, the parameter **Quantity** drives pricing in the following case.

Standalone Asset	Asset pricing Enabled	Base Price	Quantity	Term	Extended Price	Discount	Net Price	Asset Net Unit Price (Net price / Quantity*term)
Initial Sale	N/A	100	2	12	2400	350	2050	85.416

Standalone Asset	Asset pricing Enabled	Base Price	Quantity	Term	Extended Price	Discount	Net Price	Asset Net Unit Price (Net price / Quantity*term)
On load of the Cart	True	85.416 (fetched from Asset Line Item)	2	12	2050		2050	
On Change (asset)	True	85.416 (fetched from Asset Line Item)	4	12	4100	100	4000	83.333

Standalone Asset - Quantity Update

The Attribute **Service Level type** Gold has the price \$100 and type Platinum \$200. The Asset price will change based on the changes made to Service Level attribute.

Standalone Asset	Attribute (Service Level)	Base Price	Quantity	Term	Extended Price	Discount	Net Price	Asset Net Unit Price (Net price / Quantity*term)
Initial Sale	Gold	100	2	12	2400	350	2050	85.416

Standard Asset	Attribute (Service Level)	Base Price	Quantity	Term	Extended Price	Discount	Net Price	Asset Net Unit Price (Net price / Quantity*term)
On load of the Cart	Gold	85.416 (fetched from Asset Line Item)	2	12	2050		2050	
On Change (asset)	Platinum	200 (fetched from Price List Item)	2	12	4800	100	4700	195.8333

Overriding the Default Asset Pricing for Line Statuses

CPQ enables you to override the default asset pricing for some of the defined line statuses.

Prerequisites

Ensure that the **Default Asset Pricing Indicator** is turned off at **Config Settings > System Properties**.

To override default asset pricing for a line status

1. Navigate to **Setup > Develop > Custom Settings**.
2. Click **Manage** next to **Config Asset Pricing Default**. The Config Asset Pricing Default page is displayed.
3. Click **New**. The Config Asset Pricing Default Edit page is displayed.
4. In the **Name** field, enter the name of status for which you want to override the default asset pricing.
5. Select the **Default Asset Pricing Indicator** checkbox.

When you come to cart, if the line is in the status you configured above, you will see that the value is from PLI, not from the asset pricing because you have overridden the default setting.

Configuring the Installed Products Page

The Sales and Customer Service Reps use one of the [flows](#) to navigate to the Installed Products page. You must complete the following procedures to define the content and aesthetics of the Installed Products.

1. [Configuring Column Settings for the Installed Products Page.](#)
2. [Defining the Number of Products Displayed on the Installed Products Page.](#)
3. [Configuring Asset Visibility on the Installed Products Page.](#)

The values you define for the pages listed above, determines how the Sales and Customer Service Reps access and use the Installed Products page.

Accessing the Installed Products Page

To access the Installed Products Page, you must create a new quote. When you configure products, the system creates a new cart with an Account ID attached to it.

Add a few products to the new quote and finalize the cart and accept the quote. Make sure that the quote status has changed to *Accepted*. After you click the **Installed Products** button, the Installed Products page displays all the asset line item records from the account information linked to the current cart.

To configure direct navigation to the Installed Products page from the Quote/Proposal page

1. Click **Setup > Create > Objects**.
2. Select the Quote/Proposal object and from the Custom Fields & Relationships related list, select **Configure Products** with the Installed Package of Apttus Quote/Proposal-Asset Integration.
3. Click **Edit** and replace the query string with the following parameters.
For the classic CPQ,

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_QPAsset__ProposalConfiguration?id=" &Id, IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)
```

For the new UI,

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=" & Id & "&flow=ngflow&launchState=assets",  
IMAGE("/resource/Button_Configure", "Configure Products"), "_self"), NULL)
```

4. Click **Save**.

On the Quote/Proposal page when you click the **Configure Products** button, the Installed Products page appears instead of the Catalog page.

To access the Installed Products page directly from the Account page

1. Go to **Setup > Create > Objects**.
2. Select the **Account** object and from the **Custom Fields & Relationships** related list, create a new custom formula field.
3. In the Advance Formula editor, enter the query string with the following parameters.

```
HYPERLINK("/apex/Apttus_Config2__AccountOrderCreate?id=" & Id & "&method=csrFlow&priceListId=<pricelistid>&flow=csrFlow&launchState=assets&activateOrder=true&retId=" & Id , IMAGE("", "Asset Manager"), "_self")
```

In the above formula, replace **<pricelistid>** with the *ID* of your desired Price List. For the flow parameter, specify the name of the Flow that you have defined in the [Flow Settings](#).

4. Click **Save**.

This button creates an order specific to a Price List and Account ID. You may have to create different asset manager buttons for different accounts.

Configuring Column Settings for the Installed Products Page

You can customize the Installed Products page to suit both, your business requirements and the ease-of-use for the Sales and Customer Service Representatives in your organization.

To configure these settings,

1. Click **All Tabs (+) > Config Settings > Display Column Settings**.

Sequence	Display Type	Flow	Field Name	Is Sortable	Style	Style Class	Header Style		
1	Asset Line Item	Default	Product	<input type="checkbox"/>				+	▼
2	Asset Line Item	Default	Option	<input type="checkbox"/>				+	-
3	Asset Line Item	Default	Attribute Value	<input type="checkbox"/>				+	-
4	Asset Line Item	Default	Quantity	<input type="checkbox"/>	text-align:right; width:80px;	aptQuantity		+	-
5	Asset Line Item	Default	Charge Type	<input type="checkbox"/>				+	-
6	Asset Line Item	Default	Selling Term	<input type="checkbox"/>	text-align:right; width:80px;	aptQuantity		+	-
7	Asset Line Item	Default	Selling Frequency	<input type="checkbox"/>				+	-
8	Asset Line Item	Default	Start Date	<input type="checkbox"/>				+	-
9	Asset Line Item	Default	End Date	<input checked="" type="checkbox"/>				+	-
10	Asset Line Item	Default	Net Price	<input type="checkbox"/>	text-align:right;	aptCurrency		+	-
11	Asset Line Item	Default	Asset Status	<input type="checkbox"/>				+	-

2. Add the **Product** field first, followed by the **Option, Attribute, and Charge Type**.

Note

You must also ensure that the Product field in the Cart page settings is NOT EDITABLE and always the first column.

3. Click **+** to add any subsequent fields that you want on the Installed Products page.
4. Deselect the **Is Sortable?** check box for all the fields you have added.
5. Click **Save**.

Defining the Number of Products Displayed on the Installed Products Page

For the New UI, you can use the following custom setting to customize the number of products on the Installed Products page. This number can be for a specific user, based on the user's preference. The products are divided across the pages using the Pagination concept.

To enable the above enhancement:

1. Go to **Setup > Develop > Custom Settings** and search for **Config User Preferences**.

2. Click **Manage** next to **Config User Preferences**.
3. For the required user, do any of the following:
Click **View** to view the details and click **Edit**.
- Or -
Click **Edit** to edit and make changes to the existing user preferences.
4. In the **Catalog Products Per Page** field, enter the number of products that you want to display on the Catalog page per page. Valid values are *10, 20, 50, and 100*. This setting is available specially for the New UI.
In the **Selected Products Per Page** field, enter the number of products that you want to display in the mini cart on the Catalog page. Valid values here are *5, 10, 15, 20, and 25*. This setting is available for both, the enterprise CPQ and the New UI in CPQ.
5. Click **Save**.

Now, when you browse the catalog page as a specific user, you will find the specified number of products on a single page and the rest of the products are divided in multiple pages using Pagination.

Configuring Asset Visibility on the Installed Products Page

You can navigate to the Installed Products from the Catalog page, Cart page, or through the Account page with the help of different formula buttons. You can control the assets (bundles, options and attributes) displayed on the Installed Products page. You can also see critical attribute values at both, the bundle and sub-bundle level when expanding a Bundle product on this page.

 Attributes for which you select the **Is Primary** check box on the Attribute Configuration page are called Critical Attributes.

Filtering the assets on the Installed Products page

- **Search Filters:** You must create Search Filters for the Installed Products page to enable the Sales or Customer Service Reps in your organization to search for specific purchased products that customers ask to be changed, swapped, or terminated.
- **Callback class:** You must use the code in the sample `AssetLineItemCallback` class to further filter the assets on the Installed Products page. Refer to [Asset Line Item Callback Class](#) in *CPQ on Salesforce Administrator Guide*

To customize the Filter Fields on the Installed Products page

1. Click **All Tabs (+)** > **Config Settings** > **Installed Products Settings**.
2. In the Filter Fields, specify the API names of the Asset Line Item fields that you want to use as filter fields.
Currently, the fields of type *Text*, *Picklist*, *Multi-picklist*, *Date*, *Datetime* and *Boolean* are supported.
3. Click **Save**.

These fields will show up as filter fields on the Installed Products page. These fields work as temporary filters and you can change the values in these filters dynamically on the Installed Products page.

Creating Search Filters for the Installed Products Page

To create a Search Filter on the Installed Products page

1. Click **All Tabs (+)** > **Search Filter (CPQ)** > **New**.

2. Enter values for the following fields.
Filter Type - Asset
Business Object: Asset Line Item
3. Click **Next**.
4. In the Configure Filter section, enter values for the fields described in the following table.

Field	Description
Filter Name	Enter a unique name for this search filter.

Field	Description
Sequence	Enter the sequence in which the Search filter is displayed on the Installed Products page.
Description	Describe the function and purpose of this search filter to avoid duplication.
Related Roll up	Lookup and select a pre-defined roll up on which you want to base your search results.
Active	Select the checkbox so the Sales and Customer service representatives can use the filter.

5. In the Filter Criteria section, click + to add the fields you want to include to your search criteria. Use the available operators to establish the relationship with the value you define for each field.

For example, you want the Sales and Customer service representatives in your organization to be able to search for assets based on the following parameters.

- Asset Code
- Asset Name
- Asset Number
- Asset by Status
- Assets with **Auto Renew** enabled
- Assets of any Auto Renew Type
- You can add fields to the Search Filter and define values for these fields that are based on your business requirement.

6. Click **Save**.

i When you specify the value in a filter field, only those records that match the criteria of the Search Filter are displayed. For example, for **Start Date** and **End Date** filter fields, if you specify the **Start Date** as *07/01/16* and **End Date** as *07/31/16*, the system displays the assets having **Start Date** as *07/01/16* or **End Date** as *07/31/16* and not the assets falling in the range of these two dates.

Configuring Lookup Field Settings for Asset-Based Ordering

Each new lookup field shown in the cart needs a corresponding lookup field settings record. You must follow the explanation described [here](#) to create a new record for a lookup field settings.

Billing Preference look up setting

Field	Value
Name	Billing Preference

Field	Value
Display Columns	Name
Filter Criteria	Optional, to further filter the records
Lookup Field Name	API name of the Billing Preference field, <i>Apttus_Config2__BillingPreferenceId__c</i> .
Object Name	API name of the Line Item object, <i>Apttus_Config2__LineItem__c</i>

Lookup Field Settings Detail

[Back to List](#)

Name	Billing Preference Display Columns ⌵ Name
Filter Criteria ⌵	Lookup Field Name ⌵ Apttus_Config2__BillingPreferenceId__c
Object Name ⌵ Apttus_Config2__LineItem__c	

Agreement ID look up settings

Field	Value
Name	Agreement ID
Display Columns	Name
Filter Criteria	Optional, to further filter the records
Lookup Field Name	API name of the Agreement field, <i>Apttus_CMConfig__AgreementId__c</i> .
Object Name	API name of the Line Item object, <i>Apttus_Config2__AssetLineItem__c</i> .

Defining Allowed Actions for Assets

To meet specific business requirements, you can select which of the **Renew**, **Change**, **Swap**, **Terminate** actions are available for a sales user to perform for each Asset Line Item.

For example, you are an administrator for a news publication. Your company has several digital offerings that subscribers buy on a monthly term. One subscription has reached its

end-of-life. To prevent you sales representatives from renewing a customer's subscription for this product, you can exclude **Renew** from the list of Allowed Actions.

To define the Allowable Actions manually,

1. Select the Asset Line Item and click **Edit**
2. From the **Allowed Actions** field, select the actions you want to enable and move them to the Chosen column.
3. Click **Save**.

Note

If you exclude any action, the corresponding button is grayed out on the Installed Products page. If you do not select any action, by default, all the action buttons are available to the sales user for use.

- i** For **Renew**, **Terminate** and **Change** actions, you can select multiple Asset Line Items. For **Swap**, you can select one Asset Line Item at a time.

Defining Flow-based ABO Actions

Depending on your business units and type of purchase, the sales administrator can hide the action buttons on the Installed Products page. The ability to hide the action buttons is available with the flow settings defined for a Quote/Proposal. This is supported in conjunction with hiding the action buttons at the asset line item level (explained above) and global level (refer to [Installed Product Settings](#)).

Use case

For a sales-driven industry with products such as equipment (new purchase) and service (purchased for an equipment), you might want to achieve the following:

- As a manufacturing sales representative, for a service flow, you want to view the **Renew** and the **Terminate** button. For an equipment flow, you want to view the **Change** and the **Swap** button.

- As a subscription sales representative, you want to see the **Renew** button only when I make a purchase for a quote of type *renew*. For an add-on quote or an upgrade quote, you do not want to see the **Renew** button.

To define flow-based ABO action

You must have configured [Installed Product settings](#) and [Flow settings](#).

1. Create a new flow using [Flow Settings](#) or choose an existing flow for your Quote/Proposal.
2. Go to **Setup > App Setup > Develop > Custom Settings > Config System Properties > Manage**. You will see an existing record named *System Properties*.
3. Create a new record with the same name as your Flow name.
For example, if you have created a flow named *ngCPQflow*, enter *ngCPQflow* in the **Name** field.
4. In the **Hide Asset Actions** field, enter the values of action buttons that you want to hide for your flow. In our example, for a service flow, enter *Change* and *Swap*. For an equipment flow, enter *Renew* and *Terminate*.
5. Click **Save**.

About Integration of Assets with Contracts

Apttus CPQ allows you to manage assets through contracts. A contract or an agreement is a legally binding arrangement between two or more entities.

Prerequisites

- For the Assets and Contracts integration to work, the following packages must be available in your org:
 - Apttus Contract Management
 - Apttus Quote/Proposal-Contract Integration
 - Apttus Contract-Configuration Integration
- The **Auto Create Order** setting in **Comply System Properties** must be enabled if you want to create an order and asset as soon as an agreement is activated.

How asset and contract flows work

There are two process flows you must consider:

- **Contract + Proposal Flow:** In this flow, both Contract and Quote/Proposal are involved.

- **Contract Flow:** In this flow, only Contract is involved (no Quote/Proposal). The assets are created through contracts/agreements using the normal contract life cycle flow. After you finalize and activate a contract (containing agreement line items), the corresponding asset line items are created.

The following table explains the CPQ behavior when the **Auto Create Order** setting is configured.

Flow	Auto Create Order (Proposal System Properties)	Auto Create Order (Comply System Properties)	CPQ behavior
Contract + Proposal Flow	False	True	A Quote/Proposal is created followed by a Contract. The Asset Line Items and Order Line Items are created when you activate a Contract.
Contract Flow	False	True	Contract is created without a Quote/Proposal. The Asset and Order Line Items are created when you activate a Contract.

 It is recommended to refrain from enabling **Auto Activate Order** from **Comply System Properties** and **Proposal System Properties** simultaneously. The Apttus Contract Management package version must be 8.4.0325 (8.325.1) or higher to use the features mentioned above.

For more information, refer to "Managing Assets through Contracts" in *CPQ on Salesforce Administrator Guide*.

Creating Approval Workflows for Asset-Based Ordering

You can enable Apttus Advanced Approvals for your purchased products, using a few configuration steps.

Following are the sample use cases when you would want to trigger approvals:

- When your customer requests for the Renew of an asset.
- When your customer requests a change in the fields of an asset, such as Quantity or Discount Type, Discount Amount, and more.

Refer to Apttus Advanced Approvals Guide to understand and implement Advanced Approvals for your object, Assets Line Items. Since this is a custom object, you must ensure to use *Apttus_Config2__AssetLineItem__c* as the API name for customization in all of the procedures mentioned in the guide.

Once enabled, you see **Submit for Approval** button on the Cart, every time you perform action on the asset.

Configuring Mass Update for Assets

From the **Allow Mass Change** setting on the **Installed Products Settings** under **Custom Settings** page, you can enable or disable mass changes for *must configure* assets on the Installed Products page.

Action	Allow Mass Change	Type of the Asset	Type of selection	Behavior
Change	Unchecked	Must Configure	Single Select	Launch configure product page
Change	Unchecked	Must Configure	Multi Select	Disable Change
Change	Unchecked	Combination of Must configure and not must configure	Multi Select	Disable Change
Change	Unchecked	Not must configure	Single Select	Load into cart directly
Change	Unchecked	Not must configure	Multi Select	Load into cart directly
Change	Checked	Must Configure	Multi Select	Load into cart directly
Change	Checked	not Must Configure	Multi Select	Load into cart directly
Change	Checked	Must Configure	Single Select	Load into cart directly
Change	Checked	not Must Configure	Single Select	Load into cart directly

Creating Replacement Rules to Swap Assets

In order to use the **Swap** action for your purchased products, you must create a Constraint Rule of **Action Type** as *Replacement*. This rule fetches the available product in exchange of the product that you want to swap. Specify the product which you want to swap for in the Constraint Rule Condition and the product with which you want to swap to in the Constraint Rule Action.

 CPQ supports replacement rules on ABO carts only for Swap and Split-Swap.

See [Constraint Rule sections](#) to configure a Replacement Rule.

Configuring the Custom Attributes Page

You can use a pre-defined custom attribute page while navigating from the Installed Products (Assets) page. By default, CPQ chooses the *Apttus_Config2__ProductAttributeDetail3* Visualforce page. This configuration is useful when you have designed a custom attribute page with the new look and design and you want to use it while configuring the attributes.

This capability allows customers to have their own UI implementation for the product configuration experience. You can enable Sales and Customer Service representatives to select options for assets and capture product attribute details for assets.

To customize your flow settings, perform the following steps.

1. Go to **All Tabs** (☰) > **Config Settings** and click **Flow Settings**.
2. In the **Product Attribute Detail Page** field, enter the name of your custom attribute page.
3. Click **Save**.

Configuring Auto Renewal of Assets

CPQ allows Sales Representatives to auto-generate renewal quotes based on the fulfillment of order or the expiration of subscription. Through renewal quotes, they can forecast and analyze the sales pipeline. With renewal quotes, they get the finer visibility into the pricing and configuration of assets within the renewal pipeline. The benefits of auto renewals are:

- Accurate forecasting on the asset state and sales pipeline
- Faster and simpler processing with automated renewal

- Automatic closure of opportunity on asset expiry

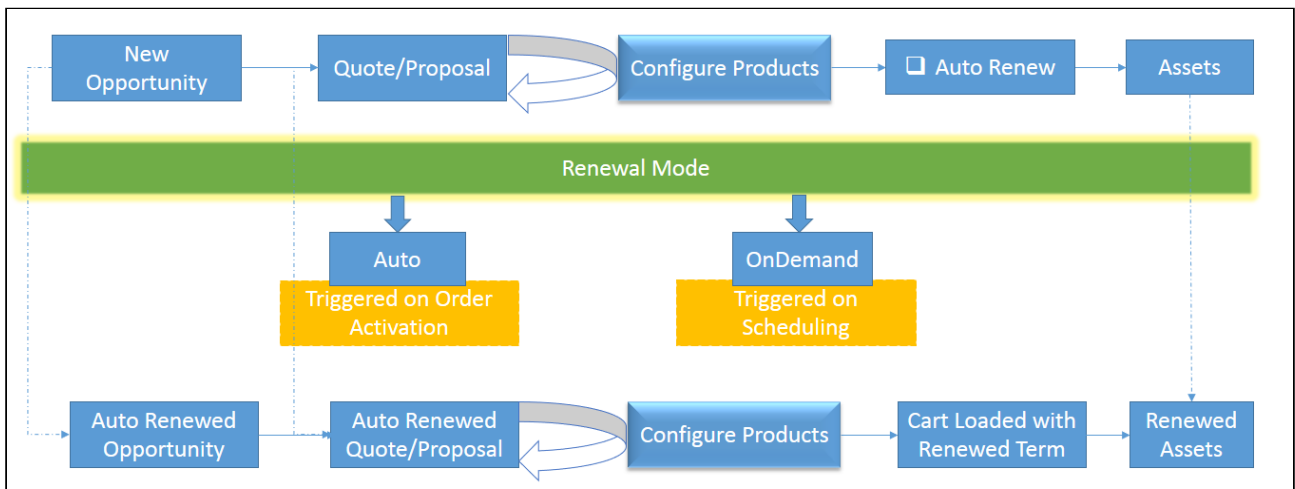

Types of Asset Renewal Modes

There are two types of renewal modes, defined in **Renewal Execution Mode**:

- Auto
- OnDemand

i It is recommended not to use these renewal modes interchangeably.

The following diagram explains how auto renewals work:

Configuring Renewal Settings

Access **Config Settings > Installed Products Settings** to see a bunch of following Renewal Field Settings.

Field	Description
Renewal Business Object Type	Enter the Business object for which this renewal is taking place. Currently, <i>Proposal</i> and <i>Agreement</i> are supported.
Renewal Default Price Book	Enter a Renewal Price Book name which you want to associate with renewals.

Field	Description
Renewal Execution Mode	<p>Indicates if the Renewal of Asset Line Items must happen automatically or based on your specified conditions.</p> <ul style="list-style-type: none"> Enter Auto to automatically create the Renewal Opportunity on Order activation. Make sure you check Auto Renew on the product PLI, from the Default tab. Enter OnDemand to create the renewal Opportunity before a certain lead time. You must enter a Renewal Lead Time for this mode to work successfully. To create a renewal Opportunity 90 days before the Asset Expiry, set the Execution Mode to <i>OnDemand</i> and Renewal Lead Time to <i>90</i>.
Renewal Group Fields	<p>Indicates how to group the Asset Line Items when a Renewal Opportunity is created. Specify the API names of the fields you want to use for grouping.</p> <p>For Execution mode set to Auto, the system will group the renewal Opportunity by default by the Auto Renew Flag - One for the Asset Lines with Auto Renew as <i>True</i> and the other for Asset Lines with Auto Renew as <i>False</i>.</p> <p>For Execution mode set to OnDemand, the system can group the renewal Opportunity by Account and the Price List. However, if the implementation teams want to group the renewal opportunities by other parameters on the Asset Line Item, they can do so by specifying a comma separated list of API names of the fields in this section. It is recommended to limit the grouping to a maximum of 4 fields.</p>
Renewal Lead Time	<p>Indicates when the Renewal Opportunity will be created after an Order is activated. By default, the value is 0, which indicates that the Renewal Opportunity is created immediately after the Order is activated, with the same number of Line Items in the Order. If you specify 30, the Renewal Opportunity is created 30 days before the Asset End Date.</p>
Default Renewal Price List	<p>Specify the Name of the Price List which is a mandatory field for Quote creation.</p>
Create Renewal Opportunity	<p>Indicates if you want to create renewal opportunities along with renewal quotes. By default, this checkbox is not selected. This is to prevent the system from running into locking issues when an account has a large number of assets and the batch process creates the renewal opportunities for all these assets.</p> <p>When set to <i>true</i>, the Create Renewal Opportunity scheduled job runs and creates the renewal opportunities along with renewal quotes.</p> <p>When set to <i>false</i>, the Create Renewal Opportunity scheduled job runs and does not create the renewal opportunities and creates only the renewal quote.</p>

AutoSync Asset Changes to an Opportunity-Based Renewal Quote

When you select the **Sync Assets to Quote** flag on a proposal, whenever an asset is changed or updated, the asset line item in the Opportunity based renewal quote is also updated.

- Asset-based Orders sync does not support Swap and Cancellation actions.
- Blocking the Asset Based Order Synchronization should always be done in the renewal quote.
- Opting out of a renewal opportunity does not pull the line out from the auto-renewal quote.
- For Assets having **Auto Renewal Type = Evergreen**, no renewal opportunities and quotes are created and the **Renew** button is greyed out.

Adding Picklist Values to the Proposal Object

1. Go to the **Proposal** object
2. Click to open Proposal from the **Record Types**.
3. Edit the Picklist **ABO Type** from the list.
4. Add *New*, *Add-on*, and *Renewal* to the list of **Selected Values**.

The screenshot shows the 'Record Type Edit' interface for the 'ABO Type' record type. It features a 'General Properties' section with a table showing 'Field Label' as 'ABO Type' and 'Record Type' as 'Proposal'. Below this is the 'Picklist Values' section, which includes instructions: 'Select an item from the Available Values list and add it to the Selected Values list to include it from any existing records. Finally, select a default picklist value for this Record Type.' The 'Available Values' list contains '--None--'. The 'Selected Values' list contains 'New', 'Add-on', and 'Renewal', which are highlighted with a red box.

Renewal Email Templates

To set up the email templates:

1. Navigate to **Setup > Communication Templates > Email Templates**.
2. Create templates for Asset Renewal Notification.
3. Select **Apttus CPQ Email Templates** from the **Folder** picklist to access existing templates or create a new one.

In the current version, you will not receive an Email notification on the generation of a Renewal Quote.

To schedule a batch job for auto renewal

You must schedule the batch job *AssetRenewalJobScheduler* for the first time. This job runs every 5 minutes after you have scheduled it.

1. Go to **Setup > Develop > Apex Classes**.
2. Click **Schedule Apex**. The Schedule Apex page is displayed.
3. In the **Job Name** field, enter a name for the job.
4. In the **Apex Class** lookup, search and select *AssetRenewalJobScheduler*.
5. Under **Schedule Apex Execution**, select the **Frequency**, **Start date**, **End date**, and **Preferred Start Time** for the job.
6. Click **Save**.

To monitor the job, go to **Setup > Monitoring > Apex Jobs**. You can see *AssetRenewalJobScheduler* in the list of jobs. You will get an email notification after this job is successfully completed.

To schedule a batch job for creating renewal opportunity

You must schedule the batch job *CreateRenewalOpportunityJobScheduler* for the first time. This job runs every 5 minutes after you have scheduled it.

1. Go to **Setup > Develop > Apex Classes**.
2. Click **Schedule Apex**. The Schedule Apex page is displayed.
3. In the **Job Name** field, enter a name for the job.
4. In the **Apex Class** lookup, search and select *CreateRenewalOpportunityJobScheduler*.
5. Under **Schedule Apex Execution**, select the **Frequency**, **Start date**, **End date**, and **Preferred Start Time** for the job.
6. Click **Save**.

To monitor the job, go to **Setup > Monitoring > Apex Jobs**. You can see *CreateRenewalOpportunityJobScheduler* in the list of jobs. You will get an email notification after this job is successfully completed.

To synchronize renewal lines to renewal opportunities

1. Create a picklist value *Create Opportunity* on the **Status** field of the **Temp Renew Asset Group** object.
2. Set the **Create Renewal Opportunity** flag to *True* on Installed Products Settings.
3. Set the following flags to True in Proposal System Properties and Comply System Properties:
 - **Auto Sync With Opportunity**
 - **Sync Bundle Using Line Items**
 - **Sync Option Products**
4. Schedule a batch job *CreateRenewalOpportunityJobScheduler* in Apex classes for creating renewal opportunity.
5. Configure renewal settings for the Proposal and Agreement objects.
6. Assign a price book that is existing in the org to the renewal opportunity.
7. After the assets are created and a renewal contract or quote is generated, a Temp record with status=*Create Opportunity* is created.
8. After the *CreateRenewalOpportunityJobScheduler* is triggered, renewal line items are synchronized with the renewal opportunity.

Renewing an Asset in Auto Renewal Mode

When **Renewal Execution Mode** is set to *Auto*, CPQ automatically renews an existing quote for all assets it has, as soon as the order is activated. You may want to renew an existing opportunity in Auto renewal mode when:

- You require renewal quotes for forecasting
- You must work on renewal quotes in advance

The following diagram describes the flow of **Auto** renewals.

Prerequisites

- Set the **Renewal Business Object Type** to Proposal.
- Set the **Renewal Execution Mode** to *Auto*.
- Define the **Renewal Group Fields**.
- Schedule the AssetRenewalJobScheduler batch job.

For more information, see [Configuring Renewal Settings](#).

Renewing an Asset in OnDemand Renewal Mode

When **Renewal Execution Mode** is set to *OnDemand*, CPQ automatically renews all assets on the account (possibly from different quotes) based on the defined **Renewal Lead Time** after you click a **custom button** on the account. You may want to renew an existing opportunity in OnDemand renewal mode:

- During one-time legacy asset data migrations
- During one time renewal quote creation for existing active asset base
- When minimal changes are required on the renewal quotes because of any ABO changes

The following diagram describes the flow of **OnDemand** renewals. In this diagram, **Renewal Lead Time** is 120 days.

Over a period of time, you sell some products/services through different quotes, which might have varying end dates. After the original quotes are converted into orders and the order are activated, assets are generated. All assets are visible on the account. When you want to renew the assets that will expire in 120 days from today, you click the **custom button** on the account. CPQ compares the asset line items' end dates with the **Renewal Lead Time** defined and triggers the creation of renewal quotes for all those assets (from different quotes) that will expire in 120 days.

Prerequisites

- Set the **Renewal Business Object Type** to Proposal.
- Set the **Renewal Execution Mode** to OnDemand.
- Create the **custom button** on the account.
- Define the **Renewal Lead Time**.
- Define the **Renewal Group Fields**.
- Schedule the AssetRenewalJobScheduler batch job.

- Navigate to Quote/Proposal and create a new link, set the content source as VF page and select *Apttus_Config2__AssetRenewalSubmit* as the VF page and click **Save**.

The screenshot shows the 'Custom Button or Link Edit' interface. The 'Label' field contains 'Submit Asset Renewal Jc'. The 'Name' field contains 'Submit_Asset_Renewal_'. The 'Display Type' is set to 'Detail Page Link'. The 'Behavior' is set to 'Display in existing window with sidebar'. The 'Content Source' is set to 'Visualforce Page'. The 'Content' dropdown menu is open, showing 'Asset Renewal Submit [Apttus_Config2__AssetRenewalSubmit]' selected.

- To do this for multiple accounts, create a custom controller and VF page. Enter the following code in the custom controller. Create a reference for the custom controller in the VF page.

```
List<ID> accountIds = new List<ID>();

// gather account ids

// instantiate the OOTB controller and pass in the account ids

Apttus_Config2.AssetRenewalSubmitController baseController = new
Apttus_Config2.AssetRenewalSubmitController(accountIds);

// submit the job

ID jobId = baseController.doSubmitJob();
```

For more information, see [Configuring Renewal Settings](#).

Configuring Agreement-Based Renewals

Apttus CPQ supports Agreement-based renewals with a custom setting called **Renewal Business Object Type**, with value as *Agreement*. The entire functionality supported with Proposal object is supported with Agreement object. For information on how

this feature works, refer to "Managing Assets in the Contract Flow" in *CPQ on Salesforce User Guide*.

For auto closure of renewal agreements, the **Status Category** of the agreement record should be one of the following:

- Request
- In Authoring
- In Signatures
- In Filing

The renewal agreement set for auto closure expires within 24 hours.

For manual submission of agreement-based renewals, you must create a new custom link for Agreement object, pointing to `Apttus_CMConfig_AgreementAssetRenewalSubmit` Visualforce page.

Please check out the **Must Knows** listed in the section *Data Flow* in [About Opportunity-Based Renewals](#) before setting up the data.

To get started with configuring data required to trigger renewal agreement creation, please refer [Configuring Renewal Settings](#).

About Extending the Lead Time Functionality

A renewals administrator at a major healthcare company can be contractually mandated to create the renewal suite 90 days before the asset expiry for a large company and 30 days before asset expiry for a small company.

The CPQ Salesforce Installed products Settings such as Lead Time and Renewal Execution Setting is OnDemand a renewal quote is generated for all accounts globally. However, if you want to generate renewals for a list of accounts for a particular lead time, you can use the following construct in the developer console.

```
// specify a lead time to override setting value
Integer leadTime = 1000;
// gather account ids
List<ID> accountIds = new List<ID>();
accountIds.add('0014C00000FQSuz');
accountIds.add('0014C00000FQSuu');
// instantiate the 00TB controller and pass in the account ids
Apttus_Config2.AssetRenewalSubmitController baseController = new
    Apttus_Config2.AssetRenewalSubmitController(leadTime, accountIds);
// submit the job
ID jobId = baseController.doSubmitJob();
```

You can use the following construct to renew assets that belong to separate list of accounts for different lead times:

```
// create map to be used as the constructor argument
Map<Integer, List<ID>> accountIdsByLeadtime = new Map<Integer, List<ID>>();
// gather account ids to be renewed with a leadTime of 400
Integer leadTime = 1000;
List<ID> accountIds = new List<ID>();
accountIds.add('0014C00000FQSV9');
// add leadTime as key and accounts as value to map
accountIdsByLeadtime.put(leadTime, accountIds);
// gather account ids to be renewed with a leadTime of 1000
leadTime = 60;
accountIds = new List<ID>();
accountIds.add('0014C00000FQSV4');
// add leadTime as key and accounts as value to map
accountIdsByLeadtime.put(leadTime, accountIds);
// instantiate the 00TB controller and pass in the account ids
Apttus_Config2.AssetRenewalSubmitController baseController = new
    Apttus_Config2.AssetRenewalSubmitController(accountIdsByLeadtime);
// submit the job
ID jobId = baseController.doSubmitJob();
```

After executing the construct, view changes on the Temp Renew page. New records are created in the Temp Renew page.

Defining Split Criteria

The Split feature allows users to clone a service with some or all related line items using in the Service Cart. The Split feature is available only at the service bundle level. You can define split criteria that apply globally or create split criteria for the specific flow.

- i** The **Service Line Split Criteria** setting only supports API names of the fields created on the Related Line Item object only. These fields can be formula fields and can fetch their values from Asset Line item and Product through formula expressions. CPQ supports the following types of custom fields on the Related Line Item object for split:
- Text
 - Picklist
 - MultiPicklist
 - Formula (return type: Text)

To define global split criteria

1. Go to **Setup > Develop > Custom Setting > Config System Properties > Service Line Split Criteria**.
2. Specify the API names of the fields from the Related Line Item object on the basis of which you want to split the service.
3. Click **Save**.

The Split functionality is enabled on the Service Cart page.

To create a flow-based split criteria

1. Remove the values in the **Service Line Split Criteria** setting in Config System Properties.
2. Create a new config system property with the name that matches with the flow name of the **Configure Product** button.
3. Add the split criteria for the new Config System Property.
4. Click **Save**.

The **Split** button is displayed only for the cart grid that is created based on the flow name.

Configuring the Cart

You can configure the following feature available on the cart.

As compared to the existing setup, the following features are not introduced in this release:

Feature	Description
Dependent Picklist for Attributes	Salesforce Dependent Picklist is not yet supported on the new CPQ user interface. Instead of using Salesforce Dependent Picklist, you can drive the product attribute selection using the Attribute Value Matrices of Apttus CPQ. By using Attribute Value Matrices , you no longer need to maintain the attribute relationships in the Salesforce object and instead you can use admin interface.
Price Breakdown for cumulative tiers and related pricing	Price breakdown information icon is not displayed for the base price on the Cart page.
Custom Labels support for Custom Display Actions	New UI does not support the creation of a new label. You need to use one of the available Custom Action labels and change the key in the Display Action Setting. You should change the Custom Display action name under the Display Action Setting and refer to one of the standard "Custom Action" labels that are provided by the managed package.

The new user interface allows you to select products, configure their attributes and options, define pricing and make adjustments, select installed products, Change, Swap and Cancel orders on one single, user-friendly page.

Configuring Flow Settings

Flow settings are required so that appropriate pages are loaded for various sections (such as Catalog, Product Configuration, Cart, and Asset). You can configure options and attributes in a single page.

To configure Flow Settings for the new user interface

1. Go to **All Tabs** (☰) > **Config Settings** and click **Flow Settings**. The page to create a new Flow setting opens.
2. Create a new record for the flow setting.
- Or -

Edit an existing record by clicking  in the **Actions** column.

3. Enter requisite information as explained in the following table:

Field	Description
Name	Enter a mandatory name for the flow setting. For example, enter ngFlow since we are defining the flow for the new user interface.
Assets Page	Enter the name of the VF page for displaying the Installed products or Assets. For example, <i>Apttus_Config2__Cart</i> .
Cart Page	Enter <i>Apttus_Config2__Cart</i> Visualforce page to access the new Cart page. If you want to view the cart with the new Grid UI, name the cart page as <i>Apttus_Config2__Cart#cartgrid</i> .
Catalog Page	Enter <i>Apttus_Config2__Cart</i> Visualforce page to access the new Catalog page.
Options Page	Enter <i>Apttus_Config2__Cart</i> Visualforce page to access the new Options page.
Product Attribute Detail Page	Enter <i>Apttus_Config2__Cart</i> Visualforce page to access the new Product Attributes page.

Custom Settings
Config Flow Edit

Flow Settings

Name: ngCPQ

Assets Page: Apttus_Config2__Cart

Cart Page: Apttus_Config2__Cart

Catalog Page: Apttus_Config2__Cart

Options Page: Apttus_Config2__Cart

Product Attribute Detail Page: Apttus_Config2__Cart

Name	Assets Page	Cart Page	Catalog Page	Options Page	Product Attribute Detail Page	Actions
Default	SelectInstalledProductsEn	Apttus_Config2__CartDetailView	Apttus_Config2__SelectConfigProductsFilterView	Apttus_Config2__SelectConfigOptionsDetailView	Apttus_Config2__ProductAttributeDetail3	
SFDC Flow	SelectInstalledProductsEn	Apttus_Config2__CartDetailView	Apttus_Config2__SelectConfigProductsFilterView	Apttus_Config2__SelectConfigOptionsDetailView	Apttus_Config2__ProductAttributeDetail3	
ngCPQ	Apttus_Config2__Cart	Apttus_Config2__Cart	Apttus_Config2__Cart	Apttus_Config2__Cart	Apttus_Config2__Cart	
ngFlow	Apttus_Config2__Cart	Apttus_Config2__Cart	Apttus_Config2__Cart	Apttus_Config2__Cart	Apttus_Config2__Cart	

4. Click **Add** if you have created a new record for flow setting.

- Or -

Click **Save** to save your modifications to existing flow setting record.

Once saved, you can also configure the columns and buttons for the different pages in your custom flow by configuring the **Display Column Settings** and **Display Action Settings**.

Creating Custom Buttons for Different Flows

To use a different flow for CPQ based on the flow settings, you must create a custom button for the Quote/Proposal object. The custom button is named **Configure Product** with a custom label you define in the formula.

1. Go to **Setup > Create > Objects** and search for **Quote/Proposal** object.
2. In the **Custom Fields & Relationships** related list, click **New**.
3. From **Step 1. Choose the field type**, choose **Formula** as Data Type and click **Next**.
4. From **Step 2. Choose the output type**, Type *Configure (Flow)* in the **Field Label**. Choose **Text** as Formula Return Type.
5. In **Step 3. Enter formula**, paste the following URL under the **Simple Formula** tab and click **Next**:

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=""&Id""&flow=ngFlow" , IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)
```

or

You can use the optimized URL to launch Catalog & Cart quickly compared to the above-mentioned URL. The reduction in time to launch Catalog and Cart compared using the optimized URL may vary and in some Orgs, the benefits may be minimal. The optimized URL primarily requires the following parameters:

- Business Object ID

- Flow

All other parameters are supported. You can update the existing Configure Products formula with the optimized launch URL. If the org has existing customization, you must test and verify the optimized URL after replacing the existing URLs. The following mentioned URL is an example of an optimized URL for the **Configure Products** button.

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_Config2__Cart?businessObjectId=&Id&"&flow=ngFlow", IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"), "_self"), NULL)
```

 Ensure that you enter the name of your Flow setting in the *flow* parameter in the above formula. In our example, it is *ngCPQ*.

6. Select appropriate Field Level Security and click **Next**.
7. Choose the page layouts on which you want to display this field.
8. Click **Save**.

You can use to following parameters in the formula to achieve different tasks.

Parameter	Description
productOrderByClause	Use this parameter to sequence the products within a Category. Refer to Sequencing Products within a Category for more details.
asyncFinalize	Use this parameter to finalize any cart asynchronously. If the parameter value is defined as <i>true</i> , upon clicking the Finalize button, the cart closes and the Sales rep if redirected to the Quote Details page. The finalization process is completed in the background. The Sales Rep must refresh to see the changed product configuration status. If the parameter value is <i>false</i> , then the cart is finalized without closing.
isCartTotalingDisabled	Set the value of this parameter to True to selectively skip totaling of pricing of products on the Cart, at a transaction level. When you add products on the cart, the totals section is not updated.

Parameter	Description
isCartApprovalDisabled	<p>Set the value of this parameter to True to selectively skip the approval of cart, at a transaction level.</p> <p>If any workflow processes are setup to trigger approvals based on criteria, they will occur when the criteria is matched. The Approval Stage inside the Quote/Proposal record is set to Approval Required. When the Approval Stage changes, the Submit for Approval button becomes available and you can submit the Quote for approval to management if any approval processes have been configured.</p> <p>If this parameter is enabled, CPQ skips the approval process even when the criteria is matched.</p>
isPricingGuidanceDisabled	<p>Set the value of this parameter to True to selectively skip deal guidance, at a transaction level.</p> <p>If you have created rules that define the various criteria of a good deal, the deal rating is available to the Sales Representatives at the time of negotiation.</p> <p>If this parameter is enabled, CPQ skips the deal guidance.</p>
deferPricingUntilCart	<p>Set the value of this parameter to True to set Defer Pricing on, at a transaction level.</p> <p>When Defer Pricing is on, CPQ performs pricing of products only after you click Go to Pricing. When Defer Pricing is off, CPQ performs pricing as and when you add or delete products.</p>
useAdvancedCurrency	<p>Set the value of this parameter to True to enable dated currency conversion on the Cart, at a transaction level.</p>

Accessing the Cart in Read-Only Mode

Apttus CPQ enables you to create a Cart in which your Sales rep can just view the product configurations and not make any changes to the field values for the Product Line Items. In order to achieve this functionality, you must specify a new parameter *mode=readOnly* while creating a custom button to launch the New UI.

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 ,HYPERLINK("/apex/Apttus_QPConfig__ProposalConfiguration?id=" &Id& "&flow=ngFlow"&"&mode=readOnly",IMAGE("/resource/Apttus_QPConfig__Button_Configure", "Configure Products"),"_self"),NULL)
```

By applying this formula to your Configure button, the checkboxes of products and the action buttons are disabled on the Cart page when the sales rep accesses the cart in read-only mode. This prevents your sales rep from applying any mass updates to the products in the Cart. In read-only mode, the Sales rep can still create views, search the products, and filter the line items on the cart.

Configuring Custom Button to Access Configuration Page Directly

You can define a formula action to configure products directly from any page in the org without having to navigate through the Catalog or Cart page. The custom button allows the Sales rep to configure products from any other page in the org by opening the Configuration page of the product directly. The Sales rep can configure attributes, options, sub-bundles on the Configuration page. For example, you can add the custom button on the Quote Detail page or the Line Item Detail page.

You can define the custom button to either add a new product to the cart or edit an existing product in the product configuration which is saved or finalized. The formula for the custom button is different based on the functionality you want to define.

You must modify URL structures to either add a new product to the cart or edit an existing product in the product configuration.

- You must use the following structures of URL to navigate directly to the Configuration page.

Task	URL
Add a new product	<i><instanceURL>/apex/Cart#/flows/<flow name>/businessObjects/<businessObjectsId>/products/<productId>/configure</i>
Edit an existing product in the quote	<i><instanceURL>/apex/Cart#/flows/<flow name>/businessObjects/<businessObjectsId>/lines/<primaryLineNumbers>/configure</i>

- To modify the URL you must gather the following values.

Value	Description
Instance URL	You can find the Instance URL from the URL of any page in your org. For example, https://cpq--test.my.salesforce.com/apex/Apttus_Config2__Cart#!/flows/CartGrid/businessObjects/a0Y7A000001kWce/products/01t3C000002Rao3/configure .
Flow name	The name of the flow using which you want to configure your product. For example, https://cpq--test.my.salesforce.com/apex/Apttus_Config2__Cart#!/flows/CartGrid/businessObjects/a0Y7A000001kWce/products/01t3C000002Rao3/configure . <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> Smart Cart flows and Partner Portal are not supported.</div>
Business Object ID	The ID of your quote/proposal, order, or agreement which you can find in the URL of the Quote Detail page. For example, https://cpq--test.my.salesforce.com/apex/Apttus_Config2__Cart#!/flows/CartGrid/businessObjects/a0Y7A000001kWce/products/01t3C000002Rao3/configure .
Product ID	The ID of the product which can find in the URL of the Product Detail page. You need the ID of the product to add a new product to the cart. For example, https://cpq--test.my.salesforce.com/apex/Apttus_Config2__Cart#!/flows/CartGrid/businessObjects/a0Y7A000001kWce/products/01t3C000002Rao3/configure . <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> In the following scenarios, the Sales rep is directed to the Catalog page instead of the Configuration page and CPQ displays an error message:<ul style="list-style-type: none">• The Product ID provided is incorrect• The Product ID belongs to a different price list that is not associated with the Business Object• The Business Object is not associated with any price list.</div>
Primary Line Number	The Primary Line Number of a product is generated on the line item after the product is added to the cart. You can find the Primary Line Number of the product on the Line Item Detail page. You need the Primary Line Number of the product to edit an existing product in the configuration. For example, https://cpq--test.my.salesforce.com/apex/Apttus_Config2__Cart#!/flows/QuotingCartGrid/businessObjects/a0Y7A000001kWce/lines/1/configure .

The following use cases describe how to define both the functionalities. The custom button on the Quote Detail page allows the Sales rep to add a new product or service each time the button is clicked. However, the custom button on the Line Item Detail page allows the Sales rep to update and modify the existing product or service.

Custom Button on Quote Detail Page to Add a New Product

On the Quote Detail page, the Sales rep must provide the URL of the product or service in a custom text field to open the Configuration page for that product or service. When the Sales rep clicks the custom button on the Quote Detail page, the product or service corresponding to the URL provided in the custom text field is added to the cart and the Configuration page of that product is displayed. If the Sales rep clicks the button multiple times, the same product is added to the cart again. You must create a custom text field on the **Quote/Proposal** object where the Sales rep can enter the product URL.

Pre-requisite

Create a custom text field in the **Quote/Proposal** object.

To create a custom button on Quote Detail page

1. Go to **Setup > Create > Objects** and search for **Quote/Proposal** object.
2. In the **Custom Fields & Relationships** related list, click **New**.
3. From **Step 1. Choose the field type**, choose **Formula** as Data Type, and click **Next**.
4. From **Step 2. Choose the output type**, Type *Configure (Flow)* in the **Field Label**. Choose **Text** as **Formula Return Type**.
5. In **Step 3. Enter formula**, paste the following URL under the **Simple Formula** tab and click **Next**:

```
IF ( LEN( Apttus_QPConfig__PriceListId__c ) > 0 , HYPERLINK("/apex/Apttus_Config2__Cart#!/flows/CartGrid/businessObjects/" &Id & "/products/"&ProductId__c&"/configure" , IMAGE("/resource/Apttus_Config2__Button_Configure", "Configure Products"), "_self"), NULL)
```

- ⓘ Ensure that you enter the name of your Flow setting in the *flow* parameter in the above formula. In our example, it is *CartGrid*.
Ensure that you replace *ProductId__c* with the name of the custom text field that you created in the **Quote/Proposal** object.

6. Select appropriate Field Level Security and click **Next**.
7. Choose the page layouts on which you want to display this field.
8. Click **Save**.

Custom Button on Line Item Detail page to Edit an Existing Product

You can add the custom button on the Line Item Detail page to allow the Sales rep to update or modify the existing product configuration of a product. The formula for the custom buttons refers to the Primary Line Number that is generated by CPQ upon adding a product to the cart, to open the Configuration page for the specific product or service.

To create a custom button on the Product Configuration page

1. Go to **Setup > Create > Objects** and search for **Line Item** object.
2. In the **Custom Fields & Relationships** related list, click **New**.
3. From **Step 1. Choose the field type**, choose **Formula** as Data Type, and click **Next**.
4. From **Step 2. Choose the output type**, Type *Configure (Flow)* in the **Field Label**. Choose **Text** as **Formula Return Type**.
5. In **Step 3. Enter formula**, paste the following URL under the **Simple Formula** tab and click **Next**:

```
IF ( LEN( Apttus_Config2__PriceListId__c ) > 0 &&
TEXT(Apttus_Config2__LineType__c) = "Product/Service" , HYPERLINK("/apex/
Apttus_Config2__Cart#!/flows/CartGrid/businessObjects/" &
Apttus_Config2__ConfigurationId__r.Apttus_QPConfig__ProposalId__c & "/lines/" &
TEXT(Apttus_Config2__PrimaryLineNumber__c)&"/configure", IMAGE("/resource/
Apttus_Config2__Button_Configure", "Config"), "_self"), NULL)
```

 Ensure that you enter the name of your Flow setting in the *flow* parameter in the above formula. In our example, it is *CartGrid*.

6. Select appropriate Field Level Security and click **Next**.
7. Choose the page layouts on which you want to display this field.
8. Click **Save**.

Sorting Main Categories on the Catalog Page

Using this feature, you can decide the sequence of the main categories. You can control the sequence of the category using the new field called **Sequence** on the Price List Category record under the Category. This helps you to customize and have a better control over the way your categories are sequenced on the Catalog page.

You must have categories created for grouping the bundle and standalone products.

To implement this enhancement:

1. Go to **All Tabs** (☰), search for **Categories** and click on it.
2. Select the main category you want to sequence.
3. In your category record, look for **Price List** related list.
4. Click **Edit** for an existing price list category.
 - Or -
 - Click **New Price List Category** to create a new record for associating your category to the price list.
5. In the **Sequence** field, enter the number in which you want to sequence the selected category.
 - If you are creating a new price list category record, select the required price list.
6. Click **Save**.
7. Perform the above steps for all the necessary main categories.

All the main categories will appear on the Catalog page in the sequence you defined.

Configuring the Location-Based Cart

Just like Enterprise CPQ, the new AngularJS based CPQ also allows grouping of products based on the location of the customer. These locations are in sync with the locations specified at the Opportunity or Account from where you create a Quote. Sales representatives can easily differentiate between products according to the location of the customer. The filtration of products is performed before loading the Cart page.

Once you save or finalize your configuration in the Enterprise CPQ, when you configure the products in the new AngularJS based cart, you have the option to group the products by location or product.

Note

Ensure that you have selected **Enable Location** check box available at **Setup > Develop > Custom Settings > Config System Properties > Manage > System Properties**.

To enable this feature in the new AngularJS based cart,

1. On your Quote/Proposal record page, search for **Proposal Location** related list and click **New Proposal Location**.

2. Create records using the look-up icon, in sync with the locations specified in the Account or Opportunity from which you have created your Quote/Proposal. For example, USA, India, UK, and China.
3. Click **Configure Products** for your Enterprise CPQ.
4. On the top-right corner, use the **Location** drop-down list to configure the products for different locations and add them to the Cart. For example, choose 2 products for the India location, 3 products for the US and so on.
5. After configuring the options and attributes for the chosen products, click **Save** on the Cart page.
6. Once you return to the Quote/Proposal detail page, click **Configure Products (new-CPQ)** or the button which you have defined for configuring the products using the new AngularJS CPQ.
7. Just above the products list, choose **Group By > Location** to see the products filtered according to the configuration you did in Step 4. You will see the products differentiated under each location.
Not Used in Quote under a location indicates that either no product is linked to the Quote/Proposal or you have not created a **Proposal Location** record for this.

Important

Ensure that you have created the **Proposal Location** records in sync with the locations of your Account or Opportunity, else you may not see the product grouping by location.

Configuring Column Settings on the Cart and Installed Products Page

The custom settings for columns defined at **All Tabs > Config Settings > Display Column Settings** are now applicable for the new AngularJS CPQ as well. Using this custom setting, you can control column style, column header, sections such as Cart Line Items and Totals which are displayed on the Cart and Installed Products (Asset) page.

To use the above custom settings, you must have defined a flow for the new AngularJS CPQ under **All Tabs > Config Settings > Flow Settings**.

1. Go to **All Tabs > Config Settings** and click **Display Column Settings**.
2. From the **Display Type** drop-down list, select the required type in which you want to customize the columns. For example, if you want to customize the columns in the main Cart Line Item section, containing columns such as Product Name, Charge Type, and more are shown, choose *Cart Line Item*.

Custom Settings
Config Custom Display Columns Edit

Save Cancel Load Default Settings

Display Column Settings ! = Required Information

Display Type: Cart Line Item
 Flow: ngFlow

Sequence	Display Type	Flow	Field Name	Is Editable	Style	Style Class	Header Style

- From the **Flow** drop-down list, choose the name of the Flow settings you have defined under **All Tabs > Config Settings > Flow Settings**.
- Specify the requisite information in the **Style**, **Style Class** and **Header Style** for each field, based on your requirement.
- Click **Save**.

Configuring the Number of Products Displayed on the Catalog Page

For the New UI, customize the following custom setting to display the number of products on the Catalog page for a specific user. The products are divided across the pages using the Pagination concept.

To customize the user preferences

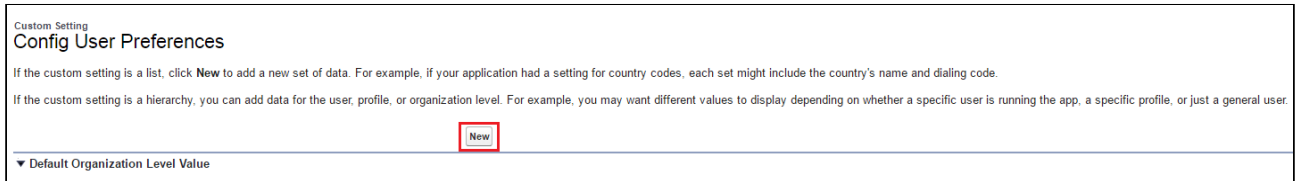

1. Go to **Setup > Develop > Custom Settings** and search for **Config User Preferences**.
2. Click **Manage** next to **Config User Preferences**.
3. For the required user, do any of the following:
Click **View** to view the details and click **Edit**.
- Or -
Click **Edit** to edit and make changes to the existing user preferences.

The screenshot shows the 'Config User Preferences Edit' page. At the top, it says 'Provide values for the fields you created. This data is cached with the application.' Below that, there are 'Save' and 'Cancel' buttons. The main section is titled 'Edit Config User Preferences' and contains a sub-section 'Config User Preferences Information'. The 'Location' is set to 'User' and the user is 'Apttus Admin'. The 'Selected Products Per Page' field is highlighted with a red box and contains the value '5'. The 'Catalog Products Per Page' field is also highlighted with a red box and contains the value '10'. Other fields include 'Category Preference', 'Items Per Page' (10), 'Collapse Error Message', 'Collapse Info Message', 'Collapse Warning Message', 'Collapse Quick Add Filter', 'Selected Comparison Products', 'Option Items Per Page', 'Flow', and 'Logging Level'.

4. In the **Catalog Products Per Page** field, enter the number of products that you want to display on the Catalog page per page. Valid values are *10, 20, 50, and 100*. This setting is available, especially for the new user interface.
You may also customize the number of products in the mini cart on the Catalog page by entering the requisite number in the **Selected Products Per Page** field. Valid values here are *5, 10, 15, 20, and 25*. This setting is available for both, the enterprise CPQ and the new user interface in CPQ.
5. Click **Save**.

When you browse the catalog page as a specific user, you will find the specified number of products on a single page and the rest of the products are divided into multiple pages using Pagination.

If you want to set up the above settings at an org level, click **New** on the Config User Preferences page.

Configuring Custom Attribute Pages

You can now use your predefined custom attribute page while navigating from the Catalog page, Mini Cart, Installed Products (Assets) page, and the Cart page in the AngularJS based CPQ UI framework. By default, the system chooses the *Apttus_Config2__ProductAttributeDetail3 VF* page. This capability allows the customers to have their own UI implementation for the product configuration experience using underlying Apttus APIs. This enhancement is useful when you have designed a custom attribute page with the new look and design and want to use it while configuring the attributes.

To use this enhancement, customize your flow settings under the Custom Settings as described below.

1. Go to **All Tabs > Config Settings** and click **Flow Settings**.
2. In the **Product Attribute Detail Page** field, enter the name of your custom attribute page.
3. Click **Save**.

Now, when you configure your attributes page by clicking **Configure** from the following pages, you will see your customized attributes page.

- **Configure** button on the Catalog page.
- Wrench icon on the Mini Cart, next to the respective product on the Catalog page.
- **Configure** button on the Installed products (Assets) page.
- Wrench icon for configuration under the Actions column, next to the respective product on the Cart page.

Hiding the Add to Cart and Configure Buttons for Option Products

In order to prevent your sales representative from mistakenly selling the option products without a bundle, you can now hide the **Add to Cart** and **Configure** buttons from the Catalog and Bundle pages. This enhancement is also useful when your customer searches for an option product using the Global search and tries to add it to the cart without buying its associated bundle product. This creates a clear difference between the standalone and option product on the Catalog page.

With this feature, for each option product, the text **Sold as Option** is displayed when you add the option product from the Catalog page without its bundle product.

To use the above enhancement, go to **Custom Settings > Config Select Products Settings** and select **Disable Add To Cart for Option Products**. For more details, refer to [Configuring Custom Settings](#).

Displaying Leaf Products on the Catalog Page

The new UI supports the custom setting **Always Display Leaf Products** to load and display all the leaf nodes for a specific category. These leaf nodes have products associated with them. With this feature, it is easier for a sales representative to just click the main category or any sub category to load all the sub-categories (and products) at one click. This feature is already available in the Enterprise CPQ.

To configure this setting,

1. Go to **Setup > Develop > Custom Settings > Config Select Product Settings**.
2. Next to **Config Select Product Settings**, click **Manage**.

3. Select the **Always Display Leaf Products** check box.

Now, if you click any category on the Catalog page, all its leaf products are displayed by default.

Cloning Sub-Bundles, Options, and Attributes on the Options Page

This feature allows to copy the options and attributes of a bundle product.

If **Allow Cloning** check box is selected for a specific product option or sub-bundle, the system will show clone icon next to the option on the configuration page while configuring the product. When you click this icon, system will clone all associated attributes as is.

This is helpful when you want to replicate the same options and its attributes under a single sub-bundle product. A single icon click makes it easier for the sales representative to clone all of these at once.

Enabling Multiple Adjustments at the Line-Item Level

Sales reps can apply multiple adjustments at the line level either by applying the adjustments in the corresponding columns or clicking the dollar icon () next to the line item from the cart page.

You can allow the sales rep to create more than one adjustment only if the Max Adjustment Lines custom setting has a value greater than 1. This setting is available at **All Tabs > Config Settings > System Properties > Pricing Settings > Max Adjustment Lines**.

The following table describes the different values of this setting and its behavior.

Max Adjustment Lines Value	Behavior
Blank field	 sign does not appear.
1	 sign appears against the line item. However, you need to use the adjustment type and adjustment amount columns in the line item itself.
>1	 sign appears against the line item. You can click on the \$ sign to open a multiple adjustment popup. You can create as many adjustments as the value defined in the Max Adjustment Lines.

To customize the fields displayed in the multiple adjustment popup, navigate to **Config Settings > Display Column Settings**. Select *Adjustment Line Item* from the **Display Type**, and *ngFlow* from the **Flow** drop down.

You can also display custom fields that you have defined for Adjustment Line Item object on the cart by using the above procedure.

You can enable users to apply an adjustment on the price of a bundle without applying that same adjustment on the options within the bundle that share the same charge type name.

You can enable users to apply an adjustment type on the bundle or total using % Discount or % Markup so that the Net Adjustment % on the Bundle or Total is set to the user requested value. CPQ allocates the adjustment to the group members (options in the case of a bundle and standalone products and options of bundles if the group is a total). The following requirements must be fulfilled to enable this feature:

- Group Adjustment Spread is set to True.
- Max Adjustment Line must be blank or 1.
- Bundle price must be zero.

The sales rep can select an adjustment from the following Adjustment Types and enter a value in Adjustment Amount column on the Cart page:

 Some of the values might not be available by default. You must add the required value to the **Adjustment Type** field in the Line Item object. Perform the following steps to add a value to the **Adjustment Type** field in the Line Item object:

1. Go to **Setup > Create > Object > Line Item > Adjustment Type**.
2. Under the section **Values**, click **New**.
3. Enter *<Value_Name>* and click **Save**.

Option	Description
% Discount	Indicates that a percentage discount is applied on the line item based on Adjustment Amount.
Discount Amount	Indicates that a flat discount is applied on the line item based on Adjustment Amount.
% Markup	Indicates that a percentage markup is applied on the line item based on Adjustment Amount.
Markup Amount	Indicates that a flat markup is applied on the line item based on Adjustment Amount.

Option	Description
Price Override	Indicates that the Adjustment Amount entered overrides the net price of the product.
Base Price Override	Indicates that the Adjustment Amount overrides the base price of the product and all the other calculations on the product would happen based on the new base price. Allow Manual Adjustment must be selected on the product line item, in order to make Base Price Override editable.
% Discount Off List	This is similar to % Discount, except that it calculates the discount amount always on the List Price of a Bundle and applies to the Extended Price.
% Uplift	This gets applied every time to products that are added from the Asset.
Price Factor	Indicates that the Adjustment Amount is multiplied with the Extended Price to calculate the new Net Price .
Base Price Discount	Indicates that the adjustment amount is reduced from the Base Price.
Base Price Markup	Indicates that the adjustment amount is added to the Base Price.
% Discount (Bundle Only)	Indicates that a percentage discount is applied on the bundle without applying that same adjustment on the options within the bundle.
Discount Amount (Bundle Only)	Indicates that a flat discount is applied on the bundle without applying that same adjustment on the options within the bundle.
% Uplift (Bundle Only)	This is applied to the bundle every time a product is added from the Asset.
% Markup (Bundle Only)	Indicates that a percentage markup is applied on the bundle without applying that same adjustment on the options within the bundle.

Option	Description
Markup Amount (Bundle Only)	Indicates that a flat markup is applied on the bundle without applying that same adjustment on the options within the bundle.
Price Override (Bundle Only)	Indicates that the Adjustment Amount entered overrides the net price of the bundle without applying that same adjustment on the options within the bundle.
Price Factor (Bundle Only)	Indicates that the Adjustment Amount is multiplied with the Extended Price to calculate the new Net Price of the bundle.
% Discount Effective	<p>Indicates that a percentage discount is applied on the bundle or total so that the Net Adjustment % on the Bundle or Total is set to the user requested value.</p> <p>This adjustment type is applicable when the following requirements are fulfilled:</p> <ul style="list-style-type: none"> • Group Adjustment Spread is set to True. • Max Adjustment Line must be blank or 1. • Bundle price must be zero.
% Markup Effective	<p>Indicates that a percentage markup is applied on the bundle or total so that the Net Adjustment % on the Bundle or Total is set to the user requested value.</p> <p>This adjustment type is applicable when the following requirements are fulfilled:</p> <ul style="list-style-type: none"> • Group Adjustment Spread is set to True. • Max Adjustment Line must be blank or 1. • Bundle price must be zero.
Price Factor Effective	<p>Indicates that the Adjustment Amount is multiplied with the Extended Price to calculate the new Net Price of the bundle or total so that the Net Adjustment % on the Bundle or Total is set to the user requested value.</p> <p>This adjustment type is applicable when the following requirements are fulfilled:</p> <ul style="list-style-type: none"> • Group Adjustment Spread is set to True. • Max Adjustment Line must be blank or 1. • Bundle price must be zero.

Configuring Option Net Adjustment Rollup to Bundle

You must set the Admin setting *APTS_RollUpOptionNetAdjustment* to *True* so that when a Sales Representative applies adjustments on options, CPQ displays the adjustments on options at the bundle and summary totals level.

1. Go to **All Tabs > Admin**.
2. Click **New** to create a new record. The New Admin page is displayed.
3. Fill the following details:

Field	Value
Name	APTS_RollUpOptionNetAdjustment
Value	true or false
Code	Leave the field blank

4. Click **Save**.

Enabling Price Breakup for Products

The Price Breakup provides additional information if the line item has related pricing or a price matrix with a dimension having cumulative range. A small icon () next to the base price is displayed if the line item uses either of the two pricing features. You can click the icon to view the additional information.

You can add custom fields on the **Price Breakup** object and add the same in **Display Column Settings** for the Price Breakup table so that when sales representatives open the Price Breakdown pop-up on the Cart, they can see columns for the added custom fields with their corresponding values. If a product line is priced using related pricing, when the sales representative clicks the price breakup icon () next to the base price on the cart, the custom field values are displayed on the Price Breakdown pop-up.

For example, a product record has various fields such as Tier 1, Tier 2, and Tier 3. These are the parameters that help the sales representative identify the product's family and its line of business. You can display these fields on the Price Breakdown pop-up so that the sales representative can understand which parameters are contributing to the related price calculation.

Prerequisite

You must have already created a Price Dimension.

To enable Price Breakup for products

1. Go to your Product and click **Product Console**.
2. Click on the PLI record and click **Edit**.
3. Under the **Matrices** tab, click **New**.
4. Select **Matrix Type** as *Dimension* and select your Price Dimension in the **Dimension 1** drop-down list.
5. In the **Dimension 1 Value Type** drop-down, select *Cumulative Range*.
6. Click **Close** to close the Matrices.
7. Click **Save** to save the PLI.

Displaying Attributes and Options Inline on the Configuration page or a Visualforce Page

For the new products (bundle or sub-bundle), you can choose to display the options and attributes as inline or on a new Visualforce page. A new drop-down list, **Config Type** is introduced to indicate this enhancement for options and attributes.

When you associate attributes or options to your product, you can choose to select *Inline* or *New Page*.

- *Inline*: The attributes and options can be configured on the configuration page.
- *New Page*: A wrench icon is displayed near the bundle or sub-bundle product which has to be configured. When you click this icon, a new page is opened for configuration of options and attributes.

By default, *Inline* option is chosen for the new products, for both, options and attributes.

If you do not choose any option from the drop-down list, no attributes and options are loaded for your product.

 This enhancement does not affect your existing product configurations and is applicable for the new products only.

Sequencing the Favorite Category on the Catalog Page

The new UI supports the custom setting **Show Favorite as First Category** to display your favorite category at the top.

To configure this setting,

1. Go to **Setup > Develop > Custom Settings > Config Select Product Settings**.
2. Next to **Config Select Product Settings**, click **Manage**.

The screenshot shows the 'Config Select Products Settings Detail' page in Salesforce. The page has a left sidebar with navigation options like 'Lightning Experience Migration Assistant', 'Salesforce1 Quick Start', 'Force.com Home', 'System Overview', 'Personal Setup', and 'App Setup'. The main content area is a table of settings. The 'Show Favorite as First Category' checkbox is checked and highlighted with a red box.

Name	Primary Settings	
Collapse All Leaf Option Groups	<input type="checkbox"/>	Cart List Item Description Field

		Listed Favorite Configurations Column2
		Save as Favorite Dialog Columns
		Show Favorite as First Category

3. Select the **Show Favorite as First Category** check box.

Now, when you have multiple product offerings, you can quickly find your favorite category on the cart. For more information, see Favorite Configurations on the Cart in the User Guide.

Configuring the Number of Option Products Displayed on the Cart

For the New UI, customize the following custom setting to display the number of option products on the cart page for a specific user. The products are divided across the pages using the Pagination concept.

To customize the user preferences

1. Go to **Setup > Develop > Custom Settings** and search for **Config User Preferences**.
2. Click **Manage** next to **Config User Preferences**.
3. For the required user, do any of the following:
 Click **View** to view the details and click **Edit**.
 - Or -
 Click **Edit** to edit and make changes to the existing user preferences.

Config User Preferences Edit

Logging Level

4. In the **Option Items Per Page** field, enter the number of option products that you want to display on the cart per page. Valid values are *5, 10, 15, 20, and 25*. This setting is available for both, the enterprise CPQ and the new user interface in CPQ.
5. Click **Save**.

When you browse the catalog page as a specific user, you will find the specified number of option products on a single page and the rest of the products are divided into multiple pages using Pagination.

If you want to set up the above settings at an org level, click **New** on the Config User Preferences page.

Configuring Save as Favorite

The Save as Favorite feature allows the sales rep to save a cart configuration for reuse. The saved configuration can be used multiple times in the same quote or across different quotes. A saved configuration includes all the selected products on the cart with the options and attributes defined within the product. The configuration can be public for all the sales reps or private to the sales rep who saved the configuration.

As an administrator, you can use various functionalities to configure the Save as Favorite feature to control the usage of the feature by the sales reps. Following functionalities are available to you to configure Save as Favorite feature.

To disable the Save as Favorite feature

By default, the feature is enabled. You can disable the feature globally or selectively apply permission to individual user or profile. Disabling the feature only disables the feature icon on the Cart page. To disable Favorite feature globally follow the steps below.

1. Go to **Setup > App Setup > Develop > Events > Custom Settings**.
2. Find **Config Select Product Setting** and click **Manage** next to the setting.
3. Click **Edit** next to **Primary Settings**.
4. Select **Disable Favorite**.
5. Click **Save**.

As a result of following the steps above the Save as Favorite icon(★) on the Cart page is disabled.

You can also control which user or profile can use Favorite Feature by defining access permissions for a user or profile.

To define permissions to use Save as Favorite feature

The administrator must define proper access permissions for user profiles to use Save as Favorite Feature. Otherwise, the user cannot see the Save as Favorite feature on the Cart page. Follow the steps below to define access permissions for the user.

1. Go to **Setup > Administrator Setup > Manage Users > Profiles**.
2. Find the profile for which you want to set permissions and click **Edit**.
3. Find **Favorite Configuration** under the section **Custom Object Permissions**.
4. Select one or more permission from the list below to define access for the profiles.

Name	Impact on the Cart Page
Read	A disabled Save As Favorite button or a star icon () is displayed on the Cart page.
Create	The Save As Favorite button is enabled on the Cart page.
Edit	The Sales rep can view and import Favorites configuration saved by others on the Catalog page when you define Edit permission
Delete	Delete option is enabled for Favorites on the Catalog page.

If you do not select any permission, the Favorite feature is disabled on the Cart page.

5. To enable **Publish** button on the Cart page, find **Published Favorite** under **Custom Object Permissions** and select **Create**.
6. Click **Save**.

Based on the permissions you define here, the sales rep can use different functionality available to them.

To hide scope field in Save as Favorite pop-up on the Cart

Follow the steps below to hide the Scope field.

1. Go to **Setup**. From the **Manage Users** drop-down, select **Profiles**.
2. Select a custom Profile.

 You can only edit these permissions for a custom profile.

3. Under the **Field-level Security** section find **Favorite Configuration** and click **View**.
4. Click **Edit**
5. To hide the Scope field clear the checkboxes **Read Access** and **Edit Access**.
6. To make the Scope field visible to the profile select the checkboxes **Read Access** and **Edit Access**.
7. Click **Save**.

The above action hides or displays the **Scope** field for a specific profile. When the **Scope** field is visible, the users can save a configuration record as **Public** or **Private** by selecting from the picklist. Otherwise, the configuration record is saved as **Private**.

Categorization of Favorite Configuration

Apttus CPQ provides sales rep the ability to categorize the saved configuration using pre-defined filters. These fields are displayed on Save as Favorite pop-up on the Cart page while saving the configuration. The fields in the filter are of picklist and multi-select picklist type that you must create in the Favorite Configuration object to use as filters. Any existing picklist or multi-select picklist fields can also be used, except for **Scope**. If you define default values or make the fields required, they are honored on the pop-up as well. Only the first five fields that you define are displayed on the pop-up.

To define filters to save a configuration

Follow the steps below after creating picklist or multi-select picklist type fields in Favorite Configuration object.

1. Go to **Setup > App Setup > Develop > Events > Custom Settings**.
2. Click **Manage** next to **Config System Properties** setting.
3. Click **Edit** next to **System Properties**.
4. Find **FavoriteFilters** and enter the API names of picklists you created, separated by comma or a new line.
5. Click **Save**.

Configuring the Smart Cart

The Smart Cart feature allows the sales rep to manage the cart with a large number of line items. In Smart Cart flow, line items in the cart are divided into groups for pricing based on the threshold and split criteria you define. The threshold defines the number of line items

in a group. The split criteria list the fields based on which the line items are grouped. You can define different threshold and criteria for different flow. You must configure the Smart Cart feature for the sales rep to use.

When you configure the product in the Smart Cart flow, you must take the following concepts into consideration.

- The option line items along with bundle line item are included in the threshold count. For example, if the threshold is 10, then in a bundle you can only select 9 options as that occupies an entire group. So, when the groups are divided on pricing, if your bundle and option line items exceed the threshold, pricing is not calculated. However, if the bundle doesn't fit in a half-full group a new group is created for that bundle as long as the line items are within the threshold limit.
- A bundle is not divided across multiple carts. If the options are auto-included or added by default and the split cart threshold is exceeded, the split function is not executed.
- Line items with multiple charge lines are divided across multiple carts if required.

Follow the steps below to configure the feature.

To add QTC profile field on Quote Detail page layout

You must add the field **QTC Profile** to the Quote Detail page layout. This field is used by the sales rep to enable the Smart Cart flow for their quote.

To define the threshold for the Smart Cart

The threshold defines the size of the group that the line items are divided into for pricing. Only the primary line items are considered in the threshold to split the cart. The primary line items consist of the line items for standalone products, bundle products and option products.

You must define the threshold considering the pricing complexity and the number of line items your pricing engine can process. If the threshold exceeds the limit of the number of line items processed in price engine, Smart Cart does not split the cart properly and the price is not calculated. Also, the bundles are not divided across multiple carts. If the number of bundles and option line items is greater than the threshold, the split function is not executed. You can increase the threshold keeping the pricing engine in consideration or restructure the bundle.

Split Cart Threshold is the primary field that Smart Cart uses to split the line items in the cart. Even if you don't define **Split Cart Criteria Fields**, the line items are grouped based on just the threshold.

Perform the following steps to set the threshold.

1. Go to **Setup > Develop > Custom Settings > Config System Properties > Manage**.
2. Find **System Properties** and click **Edit**.
3. Enter a number in the **Split Cart Threshold** field.
4. Click **Save**.

To define the split criteria for the Smart Cart

The split criteria define the criteria based on which the line items are grouped. Defining **Split Cart Criteria Fields** is optional as Smart Cart can split the cart based on just the threshold. If you define the **Split Cart Criteria Fields**, then Smart Cart considers the criteria first then the threshold. Hence, when the line items are divided, the groups are created based on the criteria first and then the number of line items in a group is controlled by Smart Cart.

Perform the following steps to set the criteria.

1. Go to **Setup > Develop > Custom Settings > Config System Properties > Manage**.
2. Find **System Properties** and click **Edit**.
3. in the **Split Cart Criteria Fields** field, enter the API names of the fields from the Line Item object, separated by commas. Only the fields with the following data types are supported as criteria:
 - Text
 - Picklist
 - Number
 - Formula fields evaluating to Text output
 - Relationship fields.

 Other data types such as Boolean, Text Area, and Rollups are not supported.

4. Click **Save**.

 If the fields you entered in **Split Cart Criteria Fields** are uncommon fields that are not used in any prominent custom settings or display columns, execute *Refresh Field Metadata* from Maintenance Console to update the data cache.

To enable actions on the cart page

In the Smart Cart flow, the action buttons are different than the actions available in a regular flow. You must enable the action buttons to display them in the action menu of the cart for Smart Cart flow. Follow the steps below.

1. Click the All Tabs icon (.
2. Go to **Config Settings>Display Action Settings**.
3. Select *Cart Page* in **Display Type** and the flow that you want to use in Smart Cart flow in **Flow**.
4. Find and select the checkbox **is Enabled** for the following actions.
 - Submit for Pricing (Async)
 - Pre-Price
 - Post-Price
5. Click **Save**.

Use Case for Configuring the Smart Cart

Description: This use case describes how the line items are grouped in Smart Cart.

Suppose you are a CPQ administrator of a company selling health care equipment to hospitals in bulk. You sell to hospitals with branches in different locations. Selling to such hospitals in bulk results in quotes with a large number of line items and configuration based on different criteria such as Location. The quotes also include the pricing details including the adjustments applied on the line items. Your Sales Rep regularly deals with such a large number of line items in a single quote. A large number of line items are difficult to handle and navigate through.

Using the Smart Cart feature, the pricing of the line items calculated in chunks based on a threshold and criteria. The cart is divided into Config and Pricing configurations based on the threshold and criteria you define.

For example, if you want to divide the line items into groups of 500 line items and create the groups based on the location of different branches of the hospital. You must define the **Split Cart Threshold** as 500 and **Split Cart Criteria Fields** as the API name of the location field.

Result

If the total number of line items the Sales Rep adds to the cart is 2000 and clicks **Submit for Pricing(Async)**. The line items are divided into groups on the quote page represented by the

configurations. Consider the below screenshot as the sample of the products added to the cart with location.

Location	Product
Loc1	Orbital Sandler
Loc2	Orbital Sandler
Loc1	Orbital Sandler
Loc4	Orbital Sandler
Loc5	Orbital Sandler
Loc6	Orbital Sandler
Loc7	Orbital Sandler
Loc8	Orbital Sandler
Loc9	Orbital Sandler
Loc10	Orbital Sandler
Loc1	Orbital Sandler
Loc2	Orbital Sandler
Loc1	Orbital Sandler
Loc4	Orbital Sandler
Loc5	Orbital Sandler
Loc6	Orbital Sandler
Loc7	Orbital Sandler
Loc8	Orbital Sandler
Loc9	Orbital Sandler
Loc10	Orbital Sandler
Loc1	Orbital Sandler
Loc2	Orbital Sandler
Loc1	Orbital Sandler
Loc4	Orbital Sandler

Based on the values of **Split Cart Threshold** and **Split Cart Criteria Fields**, the Child Carts are created as depicted in the table below, while the number in the parenthesis denotes the number of line items in the Child Cart.

Pricing Configuration	Line Item Division
1	Location 1 (200)
2	Location 2 (300)
3	Location 3 (500)
4	Location 4 (10)
5	Location 5 - 1 (500)
6	Location 5 - 2 (490)

Configuring Product Sort

Product Sorting enables the Sales rep to sort products on the Catalog page. The Catalog page is by default sorted in ascending order of Product Name, the Sales rep can change that in the **Sort** drop-down. The Sales rep can select to sort the product in either ascending or descending order of the field. In **Sort** drop-down on the Catalog page, two options are provided by default:

- *Product Name Ascending*
- *Product Name Descending*

You can add two more fields in the drop-down by defining the fields in **Product Sorting Fields** in Config System Properties. Each field you define in **Product Sorting Fields** has two entries in the **Sort** drop-down on the Catalog page, one for ascending order and other for descending order of the products.

Defining Product Sorting Fields

You can define a maximum of two additional fields in **Product Sorting Fields** to be displayed in the **Sort** drop-down apart from the field **Product Name**. **Product Name** is added by default. If you add more than two API names in **Product Sorting Fields** then only the first two values are displayed in the **Sort** drop-down.

To Define Product Sorting Fields

1. Go to **Setup > Develop > Custom Settings**.
2. Click **Manage** next to **Config System Properties**.
3. Click **Edit** next to **System Properties**.
4. In **Product Sorting Fields**, enter the API names of the fields from Product object to display the **Sort** drop-down. You can define a maximum of two fields at a time. You can add fields only from the Product object with the following data types:
 - Text
 - Number
 - Checkbox
 - Date
 - Time
 - Date/Time
 - Picklist

- Currency
5. Click **Save**.

Managing Cart Views

This section provides information on managing cart views.

About Cart Views

Apttus CPQ provides admin cart views.

You can set a cart view as default or admin for a group of users in order to provide them a tailor-made experience per business requirements.

- You can set an existing or a new cart as default or admin.
- You can create a user group based on profiles, roles, and users to assign the default view.
- You can disassociate the user groups from the default view.
- You can format the admin view layout.

The cart views uses following two objects for storing the information related to views instead of only ConfigSetting object.

- Config Field Set object

This object is used to store the field list for a particular Cart View that is created by a user.

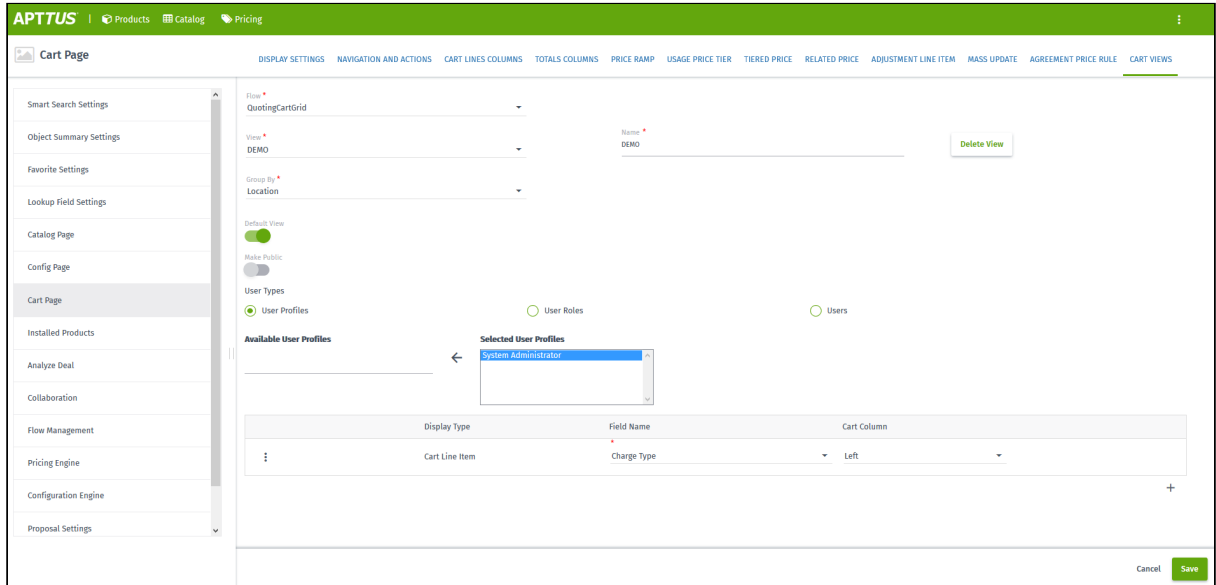

Go to **Custom Setting** > **Config Field Set** to see the view that a user has created from the Cart. The cart views created on the cart by the users are *Private* and are not visible to other users.

- User Views object

This object is used to store the association between the Cart Views and the User Type (User Profiles or User Roles or Users). It also stores information such as Flow, Default setting, Group By field, and Type of profile.

Go to **All Tabs** > **User Views** to see the view that an admin has created from the New Admin UI (CPQ Admin) > **Application Management** > **Cart Page**.

On the New Admin UI, an admin can configure a view with a Flow, View Name, Group By field, default setting, Public or Private profile type, and the User Type. Usually the view created by an admin is *Protected* by default and is visible to other users based on the eligibility. The admin can make the view public to make it visible to all users.

i A user can delete a view which is created only by the user (Private view) while an admin can delete a view which is created only by admin (Protected and Public views).

If a default view is deleted, then the next default view in the following order of precedence is displayed:

- User view = Private
- Admin views = Profile, Role, User, Public

If a user does not set the default view, then the first view that is associated with the user profile is displayed as default.

Enabling Cart View Creation in CPQ Admin Console

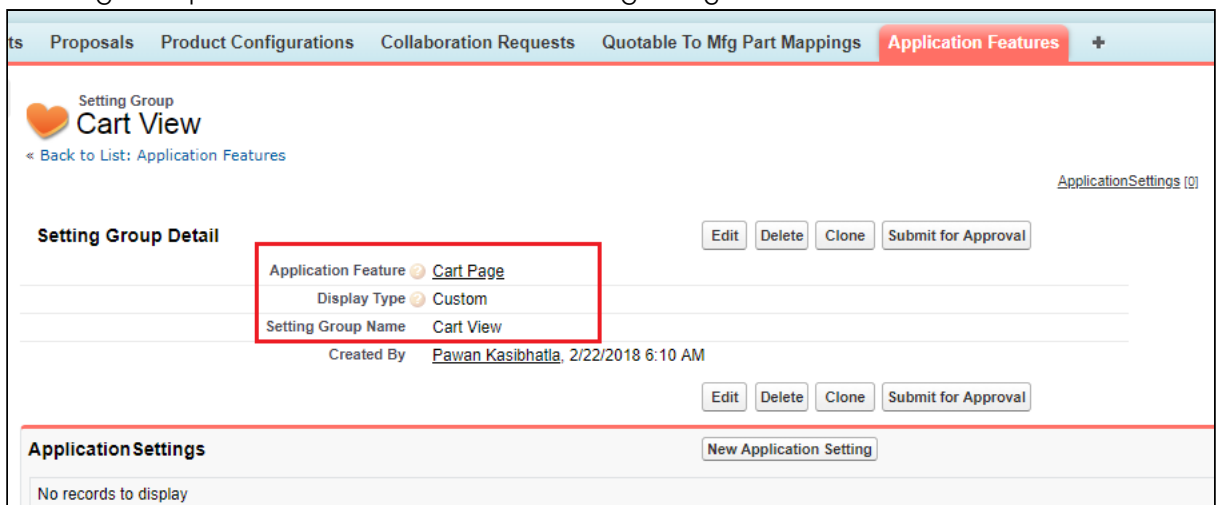

You need to configure the settings for creating a cart view in the New Admin Console of CPQ.

To create a Cart View in New Admin Console

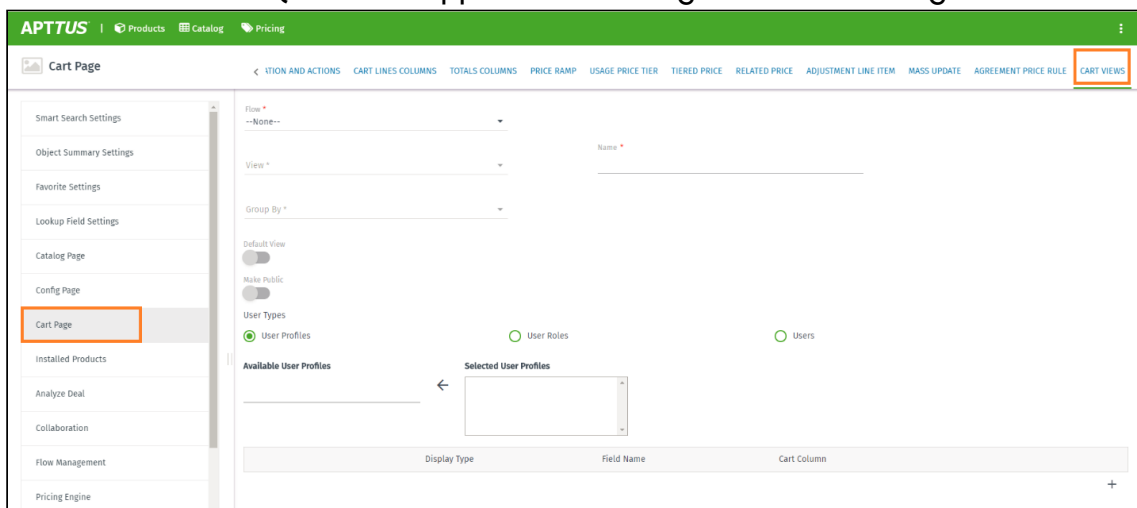

1. Go to **Custom Object Setting Group** and click **Display Type** picklist field.
2. Add the picklist value **Custom**.
3. Create a tab for **Application Features** object.
4. Go to **Application Features** tab and then click the **Cart Page** record.

i If you do not see any records under **Application Features** tab, then you need to click **Load Defaults** on CPQ Admin by navigating to **All Tabs > CPQ Admin > Application Management > Load Defaults**.

5. Edit the layout of the “Cart Page” record and add “Setting Groups” related list to it.
6. Click **New Setting Group** in the “Setting Groups” related list on the “Cart Page” layout. Fill the below details in the new setting group record for “Cart View” and save it.
7. After you create the “Cart View” setting group record, it will be available in the “Setting Groups” related list on the “Cart Page” layout as shown below:

Cart View page gets available on the CPQ Admin console. You can access this page from **All Tabs > CPQ Admin > Application Management > Cart Page > Cart Views**.

- ① To create view for a flow, first you need to configure the flow for Cart Grid by adding “#cartgrid” after the flow name.
Only those flows which are configured for Cart Grid are available in the “Flow” field on the “Cart View” page.

Running the Migration Script for Cart Views

As an existing customer, if you are upgrading to the current release, you must run a post-install script manually through the developer console to update your existing Cart Views to the new framework.

- ① For new customers, the post-install script runs automatically after you install the Apttus CPQ package.

Migration Script

Apex Code

```

public class APTS_CreateCartViews{

/**
 * Checks if the given string value is null or empty.
 * @param strValue the string to check
 * @return <code>true</code> if the string value is null or empty, <code>false</code>
otherwise
 */
public static Boolean nullOrEmpty(String strValue) {
    // check if null or zero length string
    return (strValue == null || strValue.trim().length() == 0);
}

/**
 * Checks if the given list of objects is null or empty.
 * @param objList the list of objects to check
 * @return <code>true</code> if the list is null or empty, <code>false</code>
otherwise
 */
public static Boolean nullOrEmpty(List<Object> objList) {
    // check if null or empty
    return (objList == null || objList.isEmpty());
}

/**
 * returns comma separated value
 */
public static String arrayToCSV(String[] arr){
    String str = '';
    Boolean isFirst = true;
    for(String ele : arr){
        if(isFirst){ isFirst = false; }else{
            str += ', '; //adding space since to display rule action info properly in
the layout
        }
        str += ele;
    }
    return str;
}

public static void saveFieldList(String dataStore, List<String> fieldNames) {

```

```

String names = arrayToCSV(fieldNames);
Integer len = names.length();
Integer recordCount = Integer.valueOf(Math.ceil(len * 1.0 / 255));

//delete existing records
Apttus_Config2__ConfigFieldSet__c dataCache =
Apttus_Config2__ConfigFieldSet__c.getInstance(dataStore + '_' + 0 );

                                                    WHERE Apttus_Config2__Scope__c = 'User'
                                                    LIMIT 100];

    for (Apttus_Config2__ConfigSettings__c configS0 : configS0s) {
        isProductIdCount = 0;

        // Deserialize the JSON text stored in viewSettings__c into MigrateCartView
data structure.

```

```

allOldData = parse(configS0.Apttus_Config2__ViewSettings__c);

// One record can hold setting data for more than one view. Loop thru all
views.
for (MigrateCartView oldView : allOldData) {
    allColumns = new List<String>();

    // Current design allows max 36 chars for view name. Remaining chars to
    be truncated below.
    viewName = oldView.viewName.length() > 36 ? oldView.viewName.left(36) :
oldView.viewName;
    newCartViewSettings.add(new Apttus_Config2__UserView__c (Name = viewName,
Apttus_Config2__Type__c =
'Public',
Apttus_Config2__Flow__c =
configS0.Apttus_Config2__Flow__c,
Apttus_Config2__GroupBy__c =
oldView.GroupByField,
Apttus_Config2__IsDefaultView__c
= oldView.isDefault,
Apttus_Config2__IsDefaultRecord__c = oldView.isDefault));

    // Loop through every column settings
    for(ColumnD0 ColumnD : oldView.Columns) {

        //Column pinned value left null to be changed to middle
        if (ColumnD.Pinned == 'left') {
            pinned = 'Left';
        } else if (ColumnD.Pinned == 'right') {
            pinned = 'Right';
        } else {
            pinned = 'Middle';
        }

        allColumns.add(ColumnD.FieldName + '|' + ColumnD.Sequence + '|' +
pinned);

        // Check whether the current setup contains ProductID field or
        not
        if (ColumnD.FieldName == nsPrefix + 'ProductId__r') {
            isProductIdCount++;
        }
    }
}

```

```

    }

    // Add productID if the view doesn't contain
    if (isProductIdCount == 0) {
        allColumns.add(nsPrefix + 'ProductId__r|1|Left');
    }

    // Create customsetting data for column values.
    saveFieldList(viewName, allColumns);
}

// Flag the processed data and not to migrate in next run.
configS0.Apttus_Config2__Scope__c = 'Admin';
}
if (!nullOrEmpty(configS0s)) {
    update configS0s;
}
if (!nullOrEmpty(newCartViewSettings)) {
    insert newCartViewSettings;
}
}
}

```

Run the following script manually using the developer console:

```

Savepoint sp = null;
try {
    sp = Database.setSavepoint();
    // Method to create the new Setting Group in New Admin, since Load Defaults will
    // override existing user customizations
    APTS_CreateCartViews.createCartViewsSettingGroup();

    // Method to migrate old Cart Views to the New Cart Views data model
    APTS_CreateCartViews.migrateCartViewSetting();

} catch (Exception ex) {
    Database.rollback(sp);
    System.debug(ex.getMessage());
}

```

Significance of script

In Summer 2018 Release, Cart Views functionality has been enhanced to include Cart Views Admin setup. For more information, see [About Cart Views](#).

The data model for Cart Views has been updated in order to provide better user experience and enable more features.

You have to migrate to new Cart Views for maintaining data that you created before Summer 2018 Release.

Mechanism of script

The script queries all the Cart Views that were created prior to upgrading to Summer 2018 Release and copies the related data over to the new Data Model.

It checks for Unique Name for the migration to ensure that the same Cart View is not migrated more than once.

It creates the new tab called **Cart Views** under **Cart Page** in New Admin UI. For more information, see [Application Management Settings](#)

 Old Cart Views were created by individual users and were accessible to all users. Hence after migration such old Cart Views will be marked as Public, so that all users can access them. However, due to the nature of the new enhanced Cart Views, only admin users can edit the Public Cart Views.

Customizing CPQ Using Callbacks

Callbacks provide you with a mechanism to apply custom logic on different components of CPQ like line items, Cart page, Catalog page at run-time. For example, you can apply custom pricing or validation on the line items in the cart using Pricing Callback Class and Validation Callback Class. Callbacks are implemented using interfaces that are specific to each callback. These interfaces have various methods you can use to achieve your task. You must implement the interface in an Apex class and within that Apex class, you must configure your custom logic using the methods of the interface. Once you implement the interface, register that Apex class in Custom settings to invoke the callback class on run-time.

To register Callback Class in Custom Settings

To use the Callback Class you created in Apex Classes you must register the Callback Class in the **Config Custom Classes** Custom Settings. Follow the steps below to register the Callback Class

1. Go to **Setup > Develop > Custom Settings**.
2. Click **Manage** next to **Config Custom Classes**.
3. Click **Edit** next to the **Config Custom Classes** dataset.

 Avoid creating multiple datasets. Only create a new dataset if the **Config Custom Classes** dataset is missing. You must create a new entry with the name **Config Custom Classes**.

4. Enter the name of the custom Apex class next to the Callback you implemented.
5. Click **Save**.

In this section the following Callbacks are described:

Display Action Callback Class

Display Action Callback provides you a mechanism to disable any of the action buttons on the cart. Following are few examples of custom buttons that you can disable:

- Abandon

- Approvals
- Generate
- Quick Save

To use the Display Action Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IDisplayActionCallback* interface and register the custom apex class with Display Action Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IDisplayActionCallback* interface:

Method	Signature	Description
setActionProperties()	<i>void</i> <i>setActionProperties(Apttus_Config2.CustomClass.ActionParams)</i>	You can use this method to enable or disable an action button.
start()	<i>void</i> <i>start(Apttus_Config2.ProductConfiguration, List)</i>	This is the first method that is executed when the callback is invoked.

Example

This is just a sample callback custom class to hide the visibility of the **Abandon** and **Generate** action buttons on the cart page. You may change the custom class to fit your business requirements

```

global with sharing class SampleDisplayActionCallback implements
Apttus_Config2.CustomClass.IDisplayActionCallback{

    List<Apttus_Config2.DisplayActionInfo> displayActions;
    global void start(Apttus_Config2.ProductConfiguration cart,
List<Apttus_Config2.DisplayActionInfo>displayActions){
        this.displayActions = displayActions;
    }
    global void setActionProperties(Apttus_Config2.CustomClass.ActionParams
actionParam){
        for (Apttus_Config2.DisplayActionInfo action : displayActions) {
            if(action.ActionSO.Apttus_Config2__ActionName__c == 'Abandon'){
                action.isEnabled = false;
            }
            if (action.ActionSO.Apttus_Config2__ActionName__c == 'Generate'){
                action.isEnabled = false;
            }
        }
    }
}
}

```

Product Filter Callback Class

Product Filter Callback provides you a mechanism to control the visibility of products on the catalog page based on custom criteria that you define. You can define entry criteria to determine whether a product in a price list should be filtered to a certain subset of the full list. You can define the criteria to select standalone products and option products as well. When you click **Configure Products** from a Quote/Proposal or **Add More Products** from the Cart, the CPQ checks whether the criteria are applicable for the specific price list.

To use the Product Attribute Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IProductFilterCallback* interface and register the custom apex class with Product Filter Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IProductFilterCallback* interface:

Method	Signature	Description
getOptionFilterExpr()	<i>String</i> <i>getOptionFilterExpr(Apttus_Config2.CustomClass.ActionParams)</i>	You can use this method to control the visibility of option on the Catalog page.
getProductFilterExpr()	<i>String</i> <i>getProductFilterExpr(Apttus_Config2.CustomClass.ActionParams)</i>	You can use this method to control the visibility of Stanalone and bundle products on the Catalog page.

Example

This is just a sample callback custom class to control the visibility of products on the Catalog page. The following only filter the Catalog products having color Red and the options products having color Green. You may change the custom class to fit your business requirements.

```

1  global with sharing class SampleProductFilterCallback implements
   Apttus_Config2.CustomClass.IProductFilterCallback {
2      /**
3       * Callback to return part of SOQL filter clause
4       * This filter is used in listing catalog products
5       * @param params is the Apttus_Config2.CustomClass.ActionParams that
6       * contains accountIds, locationIds when available
7       * @return The query filter is like the following.
8       * Name LIKE 'A%' AND Quantity__c > 100
9       * Id IN ('000123', '000124')
10     */
11     global String
12     getProductFilterExpr(Apttus_Config2.CustomClass.ActionParams params) {
13         return 'Color__c = \'Red\'';
14     }
15     /**
16     * Callback to return part of SOQLfilter clause
17     * This filter is used in listing option products
18     * @param parms is the CustomClass.ActionParams that contains
19     accountIds, locationIds when available
20     * @return The query filter is like the following.
21     * Name LIKE 'A%' AND Quantity__c > 100
22     * Id IN ('000123', '000124')
23     */
24     global String getOptionFilterExpr(CustomClass.ActionParams params) {
25         return 'ComponentProductId__r.Color__c = \'Green\'';
26     }
27 }

```

Option Filter Callback

Option Filter Callback provides you a mechanism to control the visibility of the option products on the Catalog page based on custom logic that you define. The callback is executed when you click **Configure Product**. When you click **Configure Products** from a Quote/Proposal or **Add More Products** from the Cart, CPQ excludes the option products from the catalog.

 Default options and options included based on constraint rules are also hidden when the Option Filter Callback is used to hide options.

To use the Option Filter Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IOptionFilterCallback* interface and register the custom apex class with Option Filter Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IOptionFilterCallback* interface:

Method	Signature	Description
getExcludedOptionIds()	<i>List getExcludedOptionIds(Apttus_Config2.CustomClass.ActionParams)</i>	You can use this method to define custom logic to hide options on the Catalog page.

Example

This is just a sample callback custom class to control the exclusion of option products on the catalog page. The following custom code only removes a few option products. You may change the custom class to list out the ID of option products to fit your business requirements.

```
global with sharing class SampleOptionFilterCallback implements
Apttus_Config2.CustomClass.IOptionFilterCallback {

    /**
     * Callback to return option IDs which are to be excluded from the bundle
     * This filter is used when we configure a bundle.
     * @param params is the CustomClass.ActionParams that contains bundleId and
productIds
     * @return List of option product IDs which will be excluded
     */
    global List<ID> getExcludedOptionIds(Apttus_Config2.CustomClass.ActionParams
params) {
        //return new List<ID>{ <18 CHARACTER PRODUCT ID> };
        //Example for returning THREE products to be excluded:
        return new List<ID>{ '01t3C000000DVwh', '01t3C000000DVwm','01t3C000000DVw
w'};
        //Example for returning ONE product to be excluded:
        // return new List<ID>{ 01t50000004nmL1YYX'};
    }
}
```

Adjustment Line Item Callback

Adjustment Line Item Callback allows you to write custom logic to auto-create or auto-delete adjustments for the line items. For example, once a product is added to cart, some adjustments need to be auto-included based on the account contract or other terms. In such a case, you can use Adjustment Line Item callback to automate this process. When you apply an adjustment on a proposal, the callback will overwrite manual adjustments.

Agents can change the discounts anytime and that will not reflect on the cart. Agents cannot do this manually per line item, so we have given the custom page for them to manage the discounts.

To use the Adjustment Line Item Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IAdjustmentLineItemCallback2* interface and register the custom apex class with Adjustment Line Item Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the

Apttus_Config2.CustomClass.IAdjustmentLineItemCallback2 interface:

Method	Signature	Description
createAdjustmentLineItems()	<i>List</i> <i>createAdjustmentLineItems(Apttus_Config2.LineItem)</i>	You can use this method to create adjustments for the given parent line item
finish()	<i>void finish()</i>	This the last method that is executed after the callback is invoked.
start()	<i>void</i> <i>start(Apttus_Config2.ProductConfiguration)</i>	This is the first method that is executed when the callback is invoked.
beforeSaveAdjustmentLineItems()	<i>Boolean</i> <i>beforeSaveAdjustmentLineItems(Apttus_Config2.LineItem, List)</i>	You can use this method to apply custom logic after the user adjustments are finished and before the changes are saved.

Example

The given code example implements *createAdjustmentLineItems()* method to create new adjustment line items using the *IAdjustmentLineItemCallback2* interface.

```

1  global with sharing class SampleAdjustmentCallback
2      implements
3      Apttus_Config2.CustomClass.IAdjustmentLineItemCallback,
4      Apttus_Config2.CustomClass.IAdjustmentLineItemCallback2 {
5      /**
6       * Callback at the beginning of the adjustment call.
7       * Use the start method to initialize state
8       * @param cart the cart object
9       */
10     global void start(Apttus_Config2.ProductConfiguration cart) {
11         // do nothing
12     }
13
14     /**
15      * Callback to create adjustments for the given parent line item
16      * @param parentItem the parent line item associated with the
17      adjustments
18      * @return the list of adjustment line item subjects
19      */
20     global List<Apttus_Config2.AdjustmentLineItem__c>
21     createAdjustmentLineItems (
22     Apttus_Config2.LineItem parentItem) {
23
24         List<Apttus_Config2.AdjustmentLineItem__c> adjItems = new
25         List<Apttus_Config2.AdjustmentLineItem__c>();
26
27         // test data
28         if (Test.isRunningTest() == true &&
29         SystemUtil.isMultiAdjustmentEnabled() == true) {
30             // get the parent item subject
31             Apttus_Config2__LineItem__c parentItemSO =
32             parentItem.getLineItemSO();
33
34             // create a line item adjustment
35             //AdjustmentLineItem__c adjItemSO = new
36             AdjustmentLineItem__c(LineItemId__c = parentItemSO.Id);
37             Apttus_Config2__AdjustmentLineItem__c adjItemSO = new
38             Apttus_Config2__AdjustmentLineItem__c();
39             // line number
40             adjItemSO.LineNumber__c = 1;

```

```

34         // line type
35         adjItemSO.LineType__c = 'Manual';
36         // modifiable
37         adjItemSO.IsModifiable__c = true;
38         // adjustment type
39         adjItemSO.AdjustmentType__c = '% Discount';
40         // adjustment amount
41         adjItemSO.AdjustmentAmount__c = 10;
42         // adjustment applies to
43         adjItemSO.AdjustmentAppliesTo__c = 'Starting Price';
44
45         adjItems.add(adjItemSO);
46     }
47     return adjItems;
48 }
49 /**
50  * Callback before the adjustment line items are saved after user
changes
51  * @param parentItem the parent line item associated with the
adjustments
52  * @param adjItems the list of adjustment line items associated with
the save operation
53  * @return <code>>true</code> if adjustment line items were modified by
the callback,
54  * <code>>false</code> otherwise
55  */
56     global Boolean beforeSaveAdjustmentLineItems(Apttus_Config2__LineItem
parentItem,
57
                                     List<
Apttus_Config2__AdjustmentLineItem__c> adjItems) {
58         return false;
59     }
60
61     /**
62  * Callback after all batches of adjustment line items are processed
63  * Use the finish method to release state
64  */
65     global void finish() {
66         // do nothing
67     }
68 }

```

Validation Callback Class

Validation Callback provides a mechanism to implement custom validations on the line items in the cart. Validations are any constraints you define on the line item to restrict the selection of that line item based on any condition or criteria. When you define validations, CPQ checks if the condition or the criteria is satisfied and displays an error message accordingly. For example, you can validate if the **Quantity** field for any product is negative and prevent the sales rep from finalizing the cart.

Validation Callback applies validation on the following aspects in the configuration:

- Line items in the cart
- Price Ramps

To use the Validation Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IValidationCallback3* interface and register the custom apex class with Validation Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IValidationCallback3* interface:

Method	Signature	Description
validateCart()	<i>Apttus_Config2.CustomClass.ValidationResult</i> <i>validateCart(Apttus_Config2.CustomClass.ActionParams, Apttus_Config2.ProductConfiguration)</i>	You can use this method to apply validation on line items in the cart. This method is invoked when the Sales rep performs the following actions: <ul style="list-style-type: none"> • View Cart • Reprice • Save • Finalize • Analyze Deal • Any action that is available on the Cart and Catalog page. • Custom actions

Method	Signature	Description
validateRampLineItems()	<i>Apttus_Config2.CustomClass.ValidationResult</i> <i>validateRampLineItems(Apttus_Config2.CustomClass.ActionParams, Apttus_Config2.ProductConfiguration, List)</i>	You can use this method to apply validation on the ramp line items in a Price Ramp. This method is invoked when the Sales rep performs the following actions: <ul style="list-style-type: none"> • Click Save on the Price Ramp pop-up • Any action that is available on the Cart and Catalog page when price ramps exist for any line item.

The following are examples of the custom logic you can implement using Validation example

Example

You can use *validateCart()* apply the following validations:

- Check if the **Duration** for any product is null.
- Check if the value in the **Adjustment Amount** field is negative.

The given code example implements two methods of *IValidationCallback3* interface. The code sample implements the abovementioned validation using the method **validateCart()**.

```

global with sharing class Test_ValidationCallBack_UC1 implements
Apttus_Config2.CustomClass.IValidationCallback3 {

    global Apttus_Config2.CustomClass.ValidationResult
    validateCart(Apttus_Config2.CustomClass.ActionParams params,
Apttus_Config2.ProductConfiguration cart) {
        system.debug('***ValidationCallBack > validateCart() > ' + cart);

        Apttus_Config2.CustomClass.ValidationResult result = new
Apttus_Config2.CustomClass.ValidationResult(true);

        list <Apttus_Config2.LineItem> allLines = cart.getLineItems();
        list<Apttus_Config2__LineItem__c> allLineItems = getLineItems(allLines);

        Id configurationId;
        if(allLineItems != null) {
            configurationId = allLineItems[0].Apttus_Config2__ConfigurationId__c;
        }

        Integer i = 0;
        System.debug('***ValidationCallBack > allLineItems: '+allLineItems.size() + '
<> ' + allLineItems);
        for(Apttus_Config2__LineItem__c lineItem : allLineItems) {
            system.debug('***ValidationCallBack > ' + (++i) + ' > lineItem : ' +
lineItem);

            // Check if the Duration for any product is null.
            if(lineItem.Apttus_Config2__SellingTerm__c == null) {
                result.Messages.add(new ApexPages.Message(ApexPages.Severity.ERROR,
'Value of Duration for product : \'' + lineItem.Apttus_Config2__Description__c + '\''
is None.'));
                result.isSuccess = false;
            }
            // Check if the value in the Adjustment Amount field is negative.
            if(lineItem.apttus_config2__adjustmentamount__c < 0) {
                result.Messages.add(new ApexPages.Message(ApexPages.Severity.ERROR,
'Adjustment Amount for product : \'' + lineItem.Apttus_Config2__Description__c + '\''
is Negative. It should be >= 0'));
                result.isSuccess = false;
            }
        }
    }
}

```

```

        return result;
    }

    global Apttus_Config2.CustomClass.ValidationResult
    validateRampLineItems(Apttus_Config2.CustomClass.ActionParams params,
    Apttus_Config2.ProductConfiguration cart,List<Apttus_Config2.LineItem> lstLI) {
        system.debug('***ValidationCallBack > validateRampLineItems() > Cart : ' +
    cart + ' <> lstTemp : ' + lstLI);
        Apttus_Config2.CustomClass.ValidationResult result;
        return result;
    }

    /* Gets the list of product line items associated with the Battery line
    * @param cart the cart object
    * @return the list of line item objects
    */
    private static List<Apttus_Config2__LineItem__c>
    getLineItems(List<Apttus_Config2.LineItem> allLines) {
        list<Apttus_Config2__LineItem__c> lineItems = new
    list<Apttus_Config2__LineItem__c>();
        // iterate through the cart and get the line items matching the battery code1
        for (Apttus_Config2.LineItem lineItemM0 : allLines) {
            lineItems.add(lineItemM0.getLineItemS0());
        }

        return lineItems;
    }
}

```

Pricing Callback Classes

Pricing Callback class enables you to add pricing logic to your cart that cannot be achieved by out of the box pricing mechanisms, such as Price Rulesets and Price Matrices. The Pricing Callback is executed for each bundled product or standalone in the cart. A separate transaction call is initiated for each product in the cart. The Pricing Callback is invoked when you are on the cart page. The pricing callback is invoked during pricing action and executes the various methods in three modes: BASEPRICE, and ADJUSTMENT.

To use the Pricing Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IPricingCallback3* interface and register the custom apex

class with Pricing Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IPricingCallback3* interface:

Method	Signature	Description
afterPricing()	<i>void afterPricing(Apttus_Config2.ProductConfiguration.LineItemColl)</i>	You can use this method to define the logic to be executed after Net Price calculation. The collection of line items currently in the cart is passed as an input parameter to this method.
afterPricingLineItem()	<i>void afterPricingLineItem(Apttus_Config2.ProductConfiguration.LineItemColl, Apttus_Config2.LineItem)</i>	You can use this method to define custom logic that has to be applied after the Net Price has been calculated. This method called for each line item in the cart.
beforePricing()	<i>void beforePricing(Apttus_Config2.ProductConfiguration.LineItemColl)</i>	You can use this method to define the logic for net price calculation. In this method, no pricelist item is associated to the cart line items. Price Matrix and Price Ruleset calculation occurs when the mode of the callback is BASEPRICE Mode.
beforePricingLineItem() ()	<i>void beforePricingLineItem(Apttus_Config2.ProductConfiguration.LineItemColl, Apttus_Config2.LineItem)</i>	You can use this method to define custom logic that has to be applied after the Base Price has been calculated but before the downstream prices like Base Extended Price , and Extended Price is calculated. This method called for each line item in the cart.
finish()	<i>void finish()</i>	This the last method that is executed after the callback is invoked.

Method	Signature	Description
setMode()	<i>void setMode(Apttus_Config2.CUSTOMCLASS.PricingMode)</i>	You can use this method to specify the mode of the callback. Based on the mode of the callback you can define different business logic. The modes are: <ul style="list-style-type: none"> • ADJUSTMENT: The mode of the callback when adjustments are made to the cart and you click Reprice. • BASEPRICE: The mode is base price when you click Go to Price.
start()	<i>void start(Apttus_Config2.ProductConfiguration)</i>	This is the first method that is executed when the callback is invoked.
onPriceltemSet()	<i>void onPriceltemSet(Apttus_Config2_PriceListItem__c, Apttus_Config2.LineItem)</i>	You can use this method to associate custom fields with line items and apply logic related to price list item. This method is called on each line item.

BASEPRICE mode is used primarily to set quantity, term and so on in the line item beforePricing() method. Base price mode is called for each line number. If there are two line numbers, the BASEPRICE mode would be invoked twice. The following methods in the callback are invoked during the BASEPRICE mode:

- start
- setMode
- beforePricing
- onPriceltemSet
- afterPricing
- finish

The line item collection in beforePricing may not match the line item collection in afterPricing if the product has multiple charge types. In this case, the afterPricing method would have more line items. Any modification to custom fields need to be done in the beforePricing method.

ADJUSTMENT mode is invoked for all items (including options) in the cart after applying adjustments to compute **Net Price**. Only the adjusted price or the adjustment amount may be changed at this point. The following methods in the callback are invoked during the Adjustment mode:

- start
- setMode
- beforePricing
- beforePricingLineItem
- afterPricingLineItem
- afterPricing
- finish

Depending on the discount applied at the group level, the `beforePricingLineItem` and `afterPricingLineItem` may be applied at the option lines after the execution of the methods at the bundle lines level.

When you define a pricing callback, ensure that you verify the following:

- Implement the latest interface version 3 for your pricing callback class.
- Choose the correct mode for your custom logic because all or some of the methods in the class will be called during each mode.
- Most widely used modes are either `BASEPRICE` or `ADJUSTMENT`.
- It is recommended to have logic in the `BASEPRICE` mode only, in the `beforePricing`, `beforePricingLineItem`, `afterPricing` and `afterPricingLineItem` methods. `ADJUSTMENT` mode is exception and should be reviewed with the Product team (PM, PST, Engg) before approval for implementation.
- `ADJUSTMENT` mode does not have all option items in Large Cart mode and hence it is preferable not to use this mode.
- Any DML statement is not required. All changes related to line items are covered regardless of DML. However, if there are other object record changes then make sure that the query is not called multiple times in a single transaction of pricing. For example, if you want to compute the **Base Price** which is based on some custom logic, assign the final calculated value to **Quantity**, **SellingTerm** or any custom field on line item.
- If your logic is dependent on **BasePrice** calculation, then make sure to use **BasePriceOverride** field of Line Item. You can put the newly computed **BasePrice** in this field and then in next mode, the system will take the value of **BasePrice** from override field to compute **ExtendedPrice** and **NetPrice**.
- When you do a **Reprice** on Cart page and change any field on the line item, which is used in Price Matrix or Price Ruleset, then `BASEPRICE` mode will get called along with `ADJUSTMENT` mode. If you change fields on the line item which are not impacting Base Price Calculations (e.g. Giving 10% discount on a bundle line item), then only `ADJUSTMENT` mode is called.

- Option Line Item are not be called in `beforePricingLineItem()` or `afterPricingLineItem()` methods in any mode. If you need to work on an option line item, then do it in `beforePricing()` or `afterPricing()` methods.
- If you want to write any custom logic that depends on price list item fields, then you should use `onPriceItemSet()` method. In this method, the system determines the corresponding price list item for a line item.
- If you have queries in callback class, it is advisable to do it in `start()` method so that it is not repeated for each line item in the before/after methods.
- Use of `updatePrice()` method should be avoided unless there is approval from the Product team.
- The custom fields on Price List Item are not retrieved in the **onPriceItemSet** method automatically. To auto-retrieve the custom fields in this method, the Administrator must create a new entry named *APTS_PriceListItemCustomFields* in **Admin**. Enter the API names of the custom field of the Price List Item in the **Code** field separated by a comma or on a new line.

```

/**
 * Apttus Config & Pricing
 * DefaultPricingCallback2
 *
 * @2011-2014 Apttus Inc. All rights reserved.
 */
global with sharing class SamplePricingCallback2 implements
Apttus_Config2.CustomClass.IPricingCallback3 {

 */
global void finish() {
}
}

```

Pricing Extension Callback Class for Smart Cart

You can use the Pricing Extension Callback Class to define any logic or computation you need to execute before or after the pricing is calculated for the line items. You must define the pre-pricing or post-pricing hooks in the Pricing Extension Callback. The pre-pricing and post-pricing logic are executed separately from the pricing that is calculated when the Sales rep clicks **Submit for Pricing(Async)** button. This allows Apttus CPQ to run the pricing without executing custom logic everytime. The pre-pricing and post-pricing logic are executed when the Sales rep clicks **Pre-Price** and **Post-Price** buttons respectively, on the Cart Summary Page and Parent Cart. The pre-pricing and post-pricing logic are executed automatically when the Sales rep clicks **Submit for Pricing(Async)** if you define **Auto Execute Post-Pricing Step** and **Auto Execute Pre-Pricing Step** settings. For more information, refer to "Config System Properties" in *CPQ on Salesforce Administrator Guide*. The following methods are available to you in Pricing Extension Callback Class.

Method	Signature	Description
afterPricing()	<i>Apttus_Config2.CustomClass.PricingExtensionResult</i> <i>afterPricing(Apttus_Config2.ProductConfiguration,</i> <i>Apttus_Config2.CustomClass.CartHelper)</i>	You can use this method to execute logic that is required post-processing after line items are priced
beforePricing()	<i>Apttus_Config2.CustomClass.PricingExtensionResult</i> <i>beforePricing(Apttus_Config2.ProductConfiguration,</i> <i>Apttus_Config2.CustomClass.CartHelper)</i>	You can use this method to execute logic that is required pre-processing to prepare the cart line items for pricing.
isAfterPricingEnabled()	<i>Boolean isAfterPricingEnabled()</i>	You can use this method to determine whether after pricing should be invoked for the callback.
isBeforePricingEnabled()	<i>Boolean isBeforePricingEnabled()</i>	You can use this method to determine whether before pricing should be invoked for the callback.

Pre-Pricing Logic

You can define logic in `beforePricing()` method of Pricing Extension callback to execute any computation that drives the pricing of the line item. For example, you can calculate the Total Quantity of reagents across all the location and use that quantity to determine the tiered price for a line item. You must specify the fields you apply pre-price to in **Custom Pre-Pricing Fields**. For more information, refer to "Config System Properties" in *CPQ on Salesforce Administrator Guide*.

Post-Pricing Logic

You can define logic in `afterPricing()` method of Pricing Extension Callback to execute any computations that are dependent on the pricing fields like **Net Price** and **Net Extended Price** which are calculated after pricing. For example, if you want to calculate the annual value for a given line item with 3 years of Selling Term and after applying adjustments the Net Price is 3000, then the annual value is $3000/3 = 1000$.

Example Code

```

/**
 * Apttus Config & Pricing
 * DefaultPricingExtensionCallback
 *
 * @2019-2020 Apttus Inc. All rights reserved.
 */
global with sharing class SamplePricingExtensionCallback3 implements
Apttus_Config2.CustomClass.IPricingExtensionCallback
{

    /**
     * Indicates whether the before pricing callback is enabled
     * Use this method to determine whether before pricing should be invoked for the
callback
     * @return <code>>true</code> if before pricing callback is enabled, <code>>false</
code> otherwise
     */
    global Boolean isBeforePricingEnabled()
    {
        return true;
    }

    /**
     * Callback before pricing the given cart
     * Use this method to do all required pre-processing to prepare the cart line
items for pricing.
     * @param cart the cart object to pre-process
     * @param helper the cart helper class
     * @return the pricing extension result object
     */
    global Apttus_Config2.CustomClass.PricingExtensionResult
beforePricing(Apttus_Config2.ProductConfiguration cart,
Apttus_Config2.CustomClass.CartHelper helper)
    {

Product Attribute Callback Class

Product Attribute Callback allows you to set the default value of the product attributes based on custom logic at run-time. The callback is invoked when you open the Configuration page to select attributes and options for the products.

To use the Product Attribute Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IProductAttributeCallback* interface and register the custom apex class with Product Attribute Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IProductAttributeCallback* interface:

Method	Signature	Description
finish()	<i>void finish()</i>	This the last method that is executed after the callback is invoked.
setDefault()	<i>void setDefaults(Apttus_Config2.LineItem, Apttus_Config2__ProductAttributeValue__c)</i>	You can use this method to set the default value of product attributes. This method is invoked only when you enable Has Attribute field for the product.
start()	<i>void start(Apttus_Config2.ProductConfiguration)</i>	This is the first method that is executed when the callback is invoked.

 You must enable **Has Attribute** field in product details. Otherwise, when the callback is invoked, only the **start()** and **finish()** methods are called and the callback does not set the default values for product attributes.

Example

In the following example, the Product Attribute Callback sets the default attributes of the Car object.

```

/*
 * Product Attribute Call Back example.
 *
 * Configure a proposal in test org, which has PriceList = 'CPQ 202'
 * Configure Product = 'Car',
 * and verify the default attributes
 * prodAttr.Exterior_Color__c = 'Silver'
 * prodAttr.Leather_Color__c = 'Brown'
 * prodAttr.Inlay__c = 'Walnut'
 * prodAttr.Fuel_Type__c = 'Diesel'
 * prodAttr.Fuel_Badge__c = 'No'
 */
global with sharing class SampleProductAttributeCallback implements
Apttus_Config2.CustomClass.IProductAttributeCallback {

    Id accountId;

    global void start(Apttus_Config2.ProductConfiguration config) {
        system.debug('***ProdAttrCallBack > start() > ' + config);
    }

    global void setDefaults(Apttus_Config2.LineItem lineItem,
Apttus_Config2__ProductAttributeValue__c prodAttr) {
        system.debug('***ProdAttrCallBack > setDefaults() > prodAttr:' + prodAttr +
';<>; lineItem:' + lineItem);

        // lineItem is a wrapper class to the lineItem class which we use in product
configuration.
        // Take line Item from this wrapper class.
        Apttus_Config2__LineItem__c prodLineItem = lineItem.getLineItemSO();

        system.debug('***ProdAttrCallBack > Product Selected: ' +
prodLineItem.Apttus_Config2__Description__c);

        if(prodLineItem.Apttus_Config2__Description__c == '(Demo) Car') {
            prodAttr.Exterior_Color__c = 'Silver';
            prodAttr.Leather_Color__c = 'Brown';
            prodAttr.Inlay__c = 'Walnut';
            prodAttr.Fuel_Type__c = 'Diesel';
            prodAttr.Fuel_Badge__c = 'No';
        }
    }
}

```

```

        if(prodLineItem.Apttus_Config2__Description__c == 'Internet Service') {
            prodAttr.Internet_Speed__c = '25 Mbps';
        }
    }

    global void finish() {
        system.debug('***ProdAttrCallBack > finish()');
    }
}

```

Related Pricing Callback Class

Related Pricing Callback allows you to apply custom logic to calculate the related pricing. This callback is invoked while CPQ is calculating related pricing after the main pricing is calculated.

To use the Related Pricing Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IRelatedPricingCallback* interface and register the custom apex class with Related Pricing Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IRelatedPricingCallback* interface:

Method	Signature	Description
computeBasePrice()	<i>Apttus_Config2.CustomClass.RelatedPriceResult</i> <i>computeBasePrice(Apttus_Config2.ProductConfiguration, Apttus_Config2.LineItem, List)</i>	You can use this method to apply custom logic for related pricing calculation and override the default CPQ related pricing logic.

If you have defined Pricing Callback class, Related Pricing Callback is always invoked after the Pricing Callback is executed.

Example

In the following sample code, Related Pricing Callback to calculates the price on related line items.

```

global with sharing class APTS_RelatedPricingCallback implements
Apttus_Config2.CustomClass.IRelatedPricingCallback {
    /**
     * Callback to compute the related price for the related line item
     * @param cart the cart object associated with the related line item
     * @param relLineItemMO the related line item to compute the base price for
     * @param breakups the list of price breakup subjects associated with the
related line item
     * @return the related price result
    */
    public Apttus_Config2.CustomClass.RelatedPriceResult
computeBasePrice(Apttus_Config2.ProductConfiguration cart, Apttus_Config2.LineItem
relLineItemMO, List<Apttus_Config2__PriceBreakup__c> breakups)
    {
        Apttus_Config2.CustomClass.RelatedPriceResult relPriceResult = new
Apttus_Config2.CustomClass.RelatedPriceResult();

        //Apttus_Config2__ProductConfiguration__c cartS0 = cart.getConfigS0();
        Apttus_Config2__LineItem__c liS0 = relLineItemMO.getLineItemS0();
        system.debug('Net Price-->' + liS0.Apttus_Config2__NetPrice__c + '
ChargeType-->' + liS0.Apttus_Config2__ChargeType__c + ' Base Price-->' +
liS0.Apttus_Config2__BasePrice__c);
        system.debug('breakups-->' + breakups);

        Decimal softwareFeesNetprice = 0;
        if(breakups != null)
        {
            for(Apttus_Config2__PriceBreakup__c b : breakups)
            {
                if(b.Apttus_Config2__BreakupType__c == 'Total' &&
liS0.Apttus_Config2__ChargeType__c == 'Maintenance Fee')
                {
                    softwareFeesNetprice += b.Apttus_Config2__RelatedNetPrice__c;
                }
            }
        }

        system.debug('softwareFeesNetprice : ' +softwareFeesNetprice+ '
liS0.Maintenance_Level_Value__c ' + liS0.Maintenance_Level_Value__c);
        if(liS0.Apttus_Config2__ChargeType__c == 'Maintenance Fee' &&
liS0.Maintenance_Level_Value__c != null)
        {
    
```

```

        relPriceResult.BasePrice = (softwareFeesNetprice *
        liSO.Maintenance_Level_Value__c)/100;
    }
    system.debug('relPriceResult.BasePrice : ' +relPriceResult.BasePrice);
    system.debug('##-- EXIT RELATED PRICING CALLBACK');
    return relPriceResult;
}
}

```

Asset Line Item Callback Class

Asset Line Item Callback provides you a mechanism to define the criteria based on which you want to filter assets on the Installed Product page. The asset line items on the Installed product page are shown according to the business logic defined in the Asset Line Item Callback class. You can further filter the asset line items on the Installed Products page using the filters on the page. You can also use this callback to validate the termination of an asset on the Asset Termination page.

To use the Asset Line Item Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IAssetLineItemCallback4* interface and register the custom apex class with Asset Line Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IAssetLineItemCallback4* interface:

Method	Signature	Description
finish()	<i>void finish()</i>	This the last method that is executed after the callback is invoked.
getAssetSearchScope()	<i>List getAssetSearchScope()</i>	You can use this method to return the asset search scope that was set in the start method.
getFilterExpr()	<i>String getFilterExpr(Apttus_Config2.Cu stomClass.ActionParams)</i>	You can use this method to set the search scope.
getQueryFilter()	<i>String getQueryFilter(Id)</i>	You can use this method to create and return the query filter.

Method	Signature	Description
start()	<i>void</i> <i>start(Apttus_Config2.ProductConfiguration, String, List)</i>	This is the first method that is executed when the callback is invoked.
validateAssetTermination()	<i>Boolean</i> <i>validateAssetTermination(Set, Set, Date)</i>	You can use this method to validate the termination of asset.
getAssetTerminationDate()	<i>Date</i> <i>getAssetTerminationDate()</i>	You can use this method to fetch the termination date of asset.

 You must update CPQ to the latest version in the Apex class that you create to implement the *Apttus_Config2.CustomClass.AssetLineItemCallback4* interface. Otherwise, any logic to default date is not executed. Follow the steps below to update the version setting.

1. Go to **Setup > Develop > Apex Classes**.
2. Open the Apex class you created to implement the Asset Line Item Callback.
3. Click **Edit**. Click **Version Settings**.
4. Find the **Apttus Configuration and Pricing** package. In the **Version** dropdown next to the package select the latest version of CPQ. For details about latest packages, refer to *CPQ on Salesforce Release Notes*.
5. Click **Save**.

Example

This is a sample callback custom class to default date and custom validation. You may change the code based on your requirement.

```

private Apttus_Config2.CustomClass.IAssetLineItemCallback4 callback = null;
private transient Apttus_Config2.ProductConfiguration cart = null;
private List<String> assetSearchScope = null;
private String assetSearchFilter = null;

/**
 * Callback at the beginning of the asset selection call.
 * Use the start method to initialize state
 * @param cart the cart object or null if there is no cart context
 * @param assetSearchFilter the preset static filter used in the asset search or null
if there is no preset filter
 * @param assetSearchScope the list of asset fields to match the search text or empty
to use the default list of fields
 */
global void start(Apttus_Config2.ProductConfiguration cart, String assetSearchFilter,
List<String> assetSearchScope) {
    // delegate to the asset callback
    this.cart = cart;
    this.assetSearchFilter = assetSearchFilter;
    this.assetSearchScope = assetSearchScope;
}

global Date getAssetTerminationDate() {
    return Date.newInstance(2018,01,01);
}

/**
 * Callback to return part of SOQL filter clause
 * This filter is used in listing installed products
 * @param accountId is the context account id
 * @return The query filter is like the following.
 *      Name LIKE 'A%' AND Quantity__c > 100
 *      Id IN ('000123', '000124')

                && assetLineItem.Apttus_Config2__IsPrimaryRampLine__c == false
                && assetLineItem.Apttus_Config2__EndDate__c >
farthestAssetLineItem.Apttus_Config2__EndDate__c) {
                farthestAssetLineItem = assetLineItem;
            }
        }
    }

    return farthestAssetLineItem;
}

```

Asset Renewal Custom Callback Class

Asset Renewal Custom Callback allows you to filter the renewal quote assets that are created using the On-Demand job. For example, you can filter assets by **Product Name** as a filter criteria. You can also use this callback to populate a selective set of parameters with corresponding values on a renewal quote (with the same data as the original quote) during renewal automation. If the user has data on the quote header that must be propagated to

line items and then be used in pricing, this callback can copy those fields to the renewal quote and pricing will be accurate on the renewal quote generated.

To use the Asset Renewal Custom Callback, you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IAssetRenewalCustomCallback* interface and register the custom apex class with Asset Renewal Custom Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IAssetRenewalCustomCallback* interface:

Method	Signature	Description
<code>getAssetFilterExpr()</code>	<i>String getAssetFilterExpr()</i>	You must use this method to append custom filters to the on-demand asset query when the asset line items are fetched from the on-demand renewal quote. If there are no additional filters (other than the standard filters), return null.
<code>getConfigProperties()</code>	<i>List getConfigProperties(SObject)</i>	You must use this method to fetch the configuration request parameters when the renewal cart is created. You can also use this method to update the proposal or agreement with default values by passing a proposal or agreement subject.

Example

In the following sample, the assets on the renewal quote are filtered based on the product name.

```

global with sharing class SampleAssetRenewalCustomCallback implements
Apttus_Config2.CustomClass.IAssetRenewalCustomCallback {

    /**
     * Callback invoked to append asset filter expression to the renew asset line
    item query
     * Filter expression should be created using asset line item fields only.
     * @return the filter expression or null to use the default filter.
     */

    global String getAssetFilterExpr() {

        Product2 prod = [SELECT ID from Product2 where Name = 'Standalone2'];
        return 'Apttus_Config2__ProductId__c = \'' + prod.Id + '\'';

    }

    /**
     * Gets the list of configuration properties for the given business SObject
     * @param bObjectSO the business Subject to get the configuration properties for
     * @return the list of configuration properties.
     */

    global List<Apttus_Config2.Property> getConfigProperties(SObject bObjectSO) {

        List<Apttus_Config2.Property> configProps = new
List<Apttus_Config2.Property>();
        configProps.add(new Apttus_Config2.Property('flow', 'LAngFlow'));
        configProps.add(new Apttus_Config2.Property('useAdvancedApproval', 'false'));
        configProps.add(new Apttus_Config2.Property('useDealOptimizer', 'false'));
        return configProps;

    }
}

```

Revalidation Callback Class

Revalidation Callback provides you a mechanism to implement custom revalidations for products based on custom criteria. You can define custom criteria based on which the products are identified by CPQ for revalidation. The callback allows you to define a custom logic to be applied on the line item along with revalidation. You can also define a custom product version when the line item is created.

To use the Revalidation Callback you must create a custom Apex class that implements the *Apttus_Config2.CustomClass.IRevalidationCallback* interface and register the custom apex class with Revalidation Callback Class. You must write your custom logic in the custom apex class.

The following methods are available in the *Apttus_Config2.CustomClass.IRevalidationCallback* interface:

Method	Signature	Description
getRevalidations()	<i>Apttus_Config2.CustomClass.RevalidationResponse getRevalidations(Apttus_Config2.CustomClass.RevalidationRequest)</i>	You can use this method to determine whether the line item requires revalidation based on a custom logic that you can define. This method is invoked when you reconfigure a save or finalized cart.
setRevalidations()	<i>void setRevalidations(Apttus_Config2.CustomClass.RevalidationRequest)</i>	You can use this method write custom logic to apply on line items. This method is invoked when you click Apply Revalidation on the Revalidation pop-up.
setVersionNumber()	<i>void setVersionNumber(Id, List)</i>	You can use this method to set the version number field of the line item with custom value based on custom logic you define. This method is invoked when you add line items to the cart.

Example

You can use this callback to a scenario like:

- You can have multiple versions for a single product record. This enables you to revalidate a specific version of the product as necessary. For example, for product record, you can set the version as X, Y, and any such value for the newly created line item of that product. You can determine which line item qualifies for revalidation and apply custom logic on the line items accordingly.
- You can apply validation based custom fields other than the **Product Version**.
- You can validate changes in pricing fields like **List price** of a given price list item.

The below-given code example checks if the quantity of line items is greater than 10 then triggers the revalidation on the cart, revalidates the line item and resets the quantity of the line items.

```

/**
 * Apttus Config & Pricing
 * SampleRevalidationCallback
 *
 * @2019-2020 Apttus Inc. All rights reserved.
 */
global with sharing class SampleRevalidationCallback implements
Apttus_Config2.CustomClass.IRevalidationCallback {
    private static String QUANTITY_TOO_HIGH = 'Quantity Too High';
    /**
     * Callback at the beginning of revalidation check.
     * use this method to get custom revalidations
     * @param request contains lineItemSO and validation info
     * @return map of revalidation category against list of line numbers
     */
    global Apttus_Config2.CustomClass.RevalidationResponse
getRevalidations(Apttus_Config2.CustomClass.RevalidationRequest request){
    Apttus_Config2.CustomClass.RevalidationResponse response = new
Apttus_Config2.CustomClass.RevalidationResponse();
    Map<String, List<Apttus_Config2__LineItem__c>> lineItemSOsByRevalCategory =
new Map<String, List<Apttus_Config2__LineItem__c>>();

    for (String revalCat : request.lineItemSOsByRevalCategory.keySet()) {
        lineItemSOsByRevalCategory.put(revalCat,
request.lineItemSOsByRevalCategory.get(revalCat));
        for (Apttus_Config2__LineItem__c lineItemSO :
request.lineItemSOsByRevalCategory.get(revalCat)) {
            response.isRevalidationNeeded = true;
        }
    }

    response.lineItemSOsByRevalCategory = lineItemSOsByRevalCategory;
    response.isHardRevalidationNeeded = false;
    List<Apttus_Config2__LineItem__c> customQuantityLines = new
List<Apttus_Config2__LineItem__c>();

    // Implementing list price change use case
    for (Apttus_Config2__LineItem__c lineItemSO : [select Id,
Apttus_Config2__Quantity__c,
Apttus_Config2__PriceListItemId__r.Apttus_Config2__ListPrice__c,
Apttus_Config2__PrimaryLineNumber__c from Apttus_Config2__LineItem__c where
Apttus_Config2__ConfigurationId__c = :request.cartId]) {

```

```

        if(lineItemSO.Apttus_Config2__Quantity__c > 10) {
            customQuantityLines.add(lineItemSO);
        }
    }
    if (customQuantityLines.size() > 0) {
        response.lineItemSOsByRevalCategory.put(QUANTITY_TOO_HIGH,
customQuantityLines);
        response.isRevalidationNeeded = true;
    }
    return response;
}

/**
 * Callback for applying revalidation
 * @param cartId Id of the cart to revalidate
 * @param lineNumbers the list of line numbers to be validated
 */
global void setRevalidations(Apttus_Config2.CustomClass.RevalidationRequest
request) {
    List<Apttus_Config2__LineItem__c> lineItemSOsToUpdate = new
List<Apttus_Config2__LineItem__c>();
    for (String revalCategory : request.lineItemSOsByRevalCategory.keySet()) {
        for (Apttus_Config2__LineItem__c lineItemSO :
request.lineItemSOsByRevalCategory.get(revalCategory)) {

            if (revalCategory == QUANTITY_TOO_HIGH) {
                lineItemSO.Apttus_Config2__Quantity__c = 1.0;
                lineItemSO.Apttus_Config2__PricingStatus__c = 'Pending!';
                lineItemSOsToUpdate.add(lineItemSO);
            }
        }
    }
    System.debug('***'+lineItemSOsToUpdate);
    if (lineItemSOsToUpdate.size() > 0) {
        System.debug('>>'+lineItemSOsToUpdate);
        update lineItemSOsToUpdate;
    }
}

/**
 * Callback to set custom version number
 * @param cartId Id of the cart
 * @param lineItemSOs the list of line Item subjects to set custom version
 */

```

```
global void setVersionNumber(ID cartId, List<Apttus_Config2__LineItem__c>
lineItemSOs){
    /*for (Apttus_Config2__LineItem__c lineItemSO : lineItemSOs) {
        lineItemSO.Apttus_Config2__ProductVersion__c = 33.0;
    }*/
}
```

Glossary of CPQ terms

A

Term	Description
Administrators	Individuals who are responsible for maintaining and mapping product catalogs and pricing.
Attribute-Based Pricing	The price is determined by factoring in attributes of a product.
Attribute Groups	Attributes associated to products
Attributes	Are used to associate certain features to a product. Examples of common attributes are color, size, weight, and more.

B

Term	Description
Base Extended Price	This is derived by Base Price X Quantity X Term.
Batch Job (CPQ)	Represents an individual batch job.
Bundle within a Bundle	Apttus allows you to create multi-layered products or "bundles within bundles."
Bundled Products	Represent a combination of standalone products that offer added value to the customer while increasing overall sales.
Bundled Services	Services sold together, as a package, rather than separately.

C

Term	Description
Categories	Categories are high-level logical groupings of products. Their grouping affects the way the end user sees them for selection in a product catalog. A category is created for browsing products in the selection pages or they can be created for creating options groups for a bundled product. Products are associated to a category through a category hierarchy. Category hierarchies are maintained using the Hierarchy Manager. They are also used to total the product prices into logical groupings.

Term	Description
Category Hierarchy	Expresses the collection of subordinate categories into a superordinate category.
Clone	To replicate a field, record, template, etc.
Configuration Rules	Ensures an error-free build or customization, even for inexperienced sales reps.
Configure Products	Button on Quote/Proposal record that allows end users to start configuring a quote.
Constraint Rule Action	Captures information about rule actions, which are only applied when the rule conditions are satisfied.
Constraint Rules	Drive automatic inclusion, exclusion, recommendation or replacement of products selected on the catalog page. Each Constraint Rule is composed of three parts; the Rule Detail, the Rule Condition and the Rule Actions.
Contractual Pricing	Customer specific contractual prices are agreed and used for a defined period.
CPQ Console	The CPQ Console allows you to manage most product and pricing functions.
Customer Priority	Field on Account record that defines customer's priority or rating.

D

Term	Description
Discrete	The system only considers specific matrix values.

L

Term	Description
Line Item	Represents a product or service line item.

N

Term	Description
New UI	Apttus CPQ's revamped user interface which is designed with AngularJS framework (client side JavaScript framework that adds interactivity to HTML). The New UI is intuitive which leads to a better user experience.

O

Term	Description
Objects	A definition of a specific type of information you can store in Salesforce. Some objects are native to Salesforce (such as Contacts or Accounts) while others are specific to Apttus functionality (such as Proposals or Agreements).
Opportunity	Salesforce Standard object that allows you to create opportunity records.
Option Group	To combine product options and then associate that group to a bundled product.
Organization	A deployment of Salesforce that has a defined set of licensed users. Your organization includes all of your data and applications, and is separate from all other organizations.

P

Term	Description
Price Adjustments	Price rules that can be made in CPQ (example: Price Matrix and Price Ruleset).
Price Dimensions	Represents a price criteria dimension.
Price List Items	Each price list item includes the list price for the product including details of cost such as per unit, flat price, one time, recurring, and more. Each price list item also represents the different ways that a customer is charged for a product; for example: license fees, implementation fees, etc. Price list items are categorized into Price Lists.
Price Lists	Containers of items that are grouped in a price list. A price list controls which products are visible to the end user. A price list contains several price list items; each linked to a product. A product can be set up with one or more price list items.
Price Matrix (Matrices)	These are an advanced pricing concept used to define tiered pricing paradigms, or complex pricing structures with multiple criteria. Common examples are pricing tiers for a product based on user count or particular customer or transactional dimensions.
Price Ramps and Price Tiers	Pricing mechanisms that establish pricing that varies by time (ramp) or quantity (tiers).

Term	Description
Price Rule	Represents a single rule in a price ruleset.
Price Rule Sets	Price Rulesets are a mechanism to allow particular families, categories or groupings of products to have either line item pricing adjustments applied or summary pricing adjustments applied. Typical examples of these are volume discounting rules or promotional pricing rules.
Product Attribute Group	Represents a product attribute group that contains attributes shared by products.
Product Attribute Value	Represents the attribute values for a product class.
Product Console	The product console helps administer product properties and associate products with other CPQ artifacts.
Product Family	Is a Salesforce standard field on the product record with configurable values. This construct allows you to create combinations of products with similar characteristics/ qualities for use in a Price Rule.
Product Group	Is an Apttus custom object that creates a logical grouping of one or more product records. This construct allows you to create combinations of products with similar characteristics/ qualities for use in a Price Rule.
Product Hierarchy	Defines the structure of the product catalog.
Product Option Group	Represents a product option group which is a member of the list of option groups associated with a product.
Products	A product or service that can be sold on its own as a standalone item, an option of other products, or as part of a bundled product. Apttus utilizes the standard Salesforce Products2 table to store product records and Apttus-specific fields on those records that manage the behavior of products.
Proposal	The Apttus custom object used to record information about a specific quote for a specific Opportunity and Account. The tab for the object is presented as Proposals and the record is stored as a Quote/Proposal.

Q

Term	Description
Quote	The Apttus custom object used to record information about a specific quote for a specific Opportunity and Account. The tab for the object is presented as Proposals: and the record is stored as a Quote/Proposal.

R

Term	Description
Records	A collection of fields that store information about a specific item of a specific type (represented by an object), such as a contact, an account, or an opportunity.

S

Term	Description
Selling Term	Field on line item object (column in cart) that defines length of time the seller will allow the buyer to pay for a product.
Standalone Products	Refers to a device or software that is self-contained, one that does not require any other devices or software to function.
Standalone Services	Refers to a service that is self-contained, one that does not require any other service to function.

T

Term	Description
Tiered Pricing Model	The longer a subscription term on a quote, the lower the monthly rate will be.

V

Term	Description
Validating	To check or prove the validity or accuracy of a value or instance.

Frequently Asked Questions

Why do I get the 'An internal server error has occurred' message when I click Configure Products, Go to Pricing, or Reprice?

This is a Salesforce error. Contact Salesforce Support for further assistance.

Why can't I approve requests using email notifications?

1. Make sure that the email id saved in the email reply template on the visual force page is the same as the one saved in **Custom Settings > Email Services**.
2. Make sure that the Approver is a registered User with a valid Apttus license and then complete the following procedures.
 - a. Click **Develop > Email Services** to create a new email service using ApprovalEmailHandler and generate an email address.
 - b. Click **Develop > Custom Settings > Approval System Properties** and enter values for the fields described in the following table.

Field	Value
Enable Email Approval Response	Select the check box.
Email Approval Service Address	Enter the approver's email address.

- c. On the Visual force email template (that is sent during approval submission) and enter the email address you generated in step 2.a, in the **Reply To** attribute of the template.
- d. Make sure that the template has the following fields.
 - i. **Approval Request ID**
 - ii. **Approval User ID**
- e. If you use a Custom VF Email Template, make sure the Apttus standard Merge fields (Approval ID and User ID) are NOT defined in Table format in code in Custom VF template or associated component. If these merge fields are in a Table format then Email to Approval will not work.

Note

Apttus does not support the system fields (Approval ID and User ID) in tabular format in the Custom VF email template code or the associated component code.

To resolve this, you must remove the Apttus standard Merge fields (**Approval ID** and **User ID**) from table and insert them separately in the following format.

Approval Request ID: {!relatedTo.ID}

Approval User ID: {!relatedTo.Apttus_Approval__Assigned_To_Id__c}

How can I resolve a hung page when I try to check-in or check-out any document on Apttus Author?

1. Make sure your profile has permission to Read, Create, Edit, and Delete the Template Object.
2. Make sure your profile has access to the following Visual force pages.
 - a. Apttus.BrowseTemplates
 - b. Apttus.BrowseAgreements
3. Log in with your credentials and paste the following link in the browser's URL.
https://<instance>.salesforce.com/apex/Apttus__BrowseTemplates?callerMode=Checkout

Why do I get the 'An internal server error has occurred' message when I click Configure Products, Go to Pricing, or Reprice? Why does my sandbox instance redirect to my production instance whenever I refresh the page?

This is a Salesforce error. Contact Salesforce Support for further assistance.

Why do I get the 'An internal server error has occurred' message when I click Configure Products, Go to Pricing, or Reprice?

When you refresh the sandbox, the app copies all the data and components from the production instance to the sandbox instance.

The following table lists the applications and corresponding custom settings you must change or verify to resolve this issue.

 **Note**

The instructions in the following table direct you to change settings in your sandbox instance. If you face the same problem on your production instance (switching to the sandbox instance when you refresh), use the same procedure but be sure to enter the URL for the production instance.

App	Settings
-----	----------

Apttus CPQ	<ol style="list-style-type: none"> 1. Click Setup > App Setup > Develop > Custom Settings > Config System Properties > Edit System Properties. 2. Change the Production instance URL to the sandbox instance URL.
Apttus CLM	<ol style="list-style-type: none"> 1. Click Setup > App Setup > Develop > Custom Settings > Comply System Properties > Edit System Properties. 2. Change the Production instance URL to the sandbox instance URL.
Apttus Approval Management	<ol style="list-style-type: none"> 1. Click Setup > App Setup > Develop > Custom Settings > Approval System Properties > Edit System Properties. 2. Change the Production instance URL to the sandbox instance URL.

What Object references should I set to the instance of an Object so I can log in to X-author for contracts?

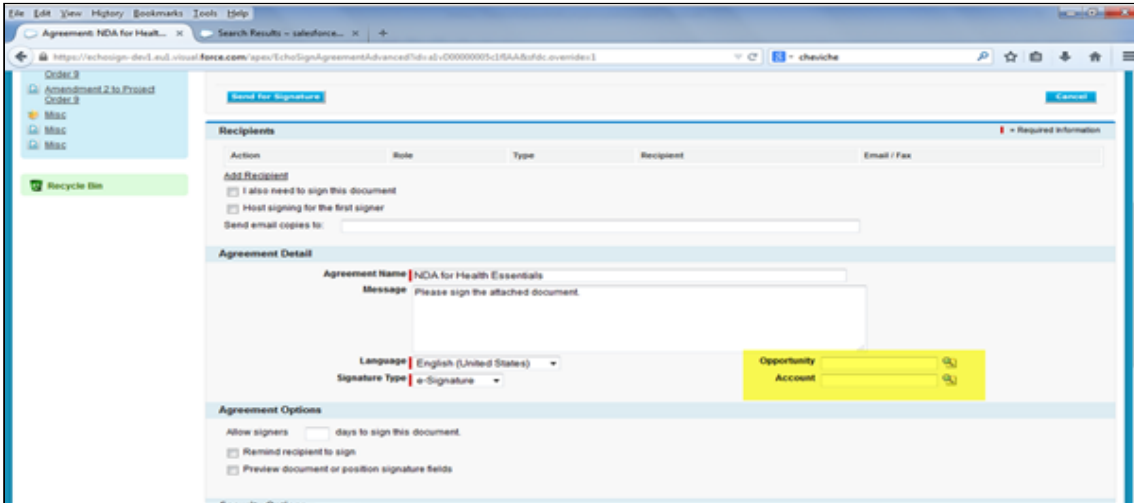

If you have this question, you receive the following message when you try to log in to X-Author for Contracts.

This error is not because there are Object permission issues in CPQ, in spite of the wording, this is a Time Zone error. To resolve this issue, change the time zone in the user profile settings to match the time zone in the Org settings.

How do I get the EchoSign Send page to auto-populate the Account and Opportunity fields?

The Account and Opportunity fields on the EchoSign Send page are lookup fields and the Apttus Integration Adaptor cannot auto-populate these fields.

To auto-populate these fields, employ one of the following work-around.

1. Create a custom trigger to auto-populate the **Account** and **Opportunity** fields from the Agreement. Because these are lookup fields, you cannot use workflow rules.
2. Click **Custom Settings > EchosignSettings > Edit**.
3. On the EchoSign settings page, uncheck the following check boxes.
 - **Disable Opportunity Lookup**
 - **Disable Account Lookup**
4. Click **Save**.

How do I enter values for custom fields on the Price List Item page?

The Price List Item detail page is a managed, custom visual force page where you cannot enter values for custom fields.

To be able to enter values on the Price List Item detail page, you must create a button of type URL that sales users can access to define values for custom fields. Use the following URL when you create this button.

```
{!URLFOR($Action.Apttus_Config2__PriceListItem__c.Edit,
Apttus_Config2__PriceListItem__c.Id,
[retURL=URLFOR($Action.Apttus_Config2__PriceListItem__c.View,Apttus_Config2__PriceListItem__c.Id)],true)}
```

How is the Base Price calculated when I renew or change an asset with custom pricing?

You must use custom pricing for an asset if you want to override the defined current price of the asset.

For example, you are a Sales Representative for a software company and you receive a request to renew a software subscription. The price of the original order is \$100.00. The

current price of the product is 150.00. You can process the renewal for the original price if you enable Custom Pricing.

If you have enabled Custom Pricing for an asset, Apttus CPQ uses the Net Price of the asset to calculate the asset price. The formula is *Net Price/Quantity*Term*.

When I create any template, why do I see the following error?

Error: Script Thrown Exception

Your profile does not have Edit permissions and so you do not have access to the following custom fields for the Agreement Object.

- Status Category
- Status
- Workflow Trigger Generated Agreement

Ask your system administrator to enable Edit permissions for the Agreement Object.

How do I change the label for an Apttus Managed field?

To change the label of an Apttus Managed field,

1. Click **Setup > Translation Workbench > Override**.

2. Double click in the **Field Label Override** column to enter a new value.
3. Click **Save**.

How do I clone a User Record?

Cloning a User record is not a Salesforce function. You must create a custom link along with formula to clone a user record.

Create a custom link with the following formula.

```
/{!User.Id}/e?clone=1&retURL=%2F{!User.Id}&name_firstName=&name_lastName=&Alias=&Em
```

How do I add the Apttus Generate document functionality on any custom object?

You can add the Apttus Generate document functionality on any custom object by creating a formula on the custom object **Edit**.

1. Click **Setup > Build > Develop > Custom Settings > Comply System Properties > System Properties > Edit**.

The screenshot displays the 'Edit Comply System Properties' interface in Salesforce. The page title is 'Comply System Properties Edit'. Below the title, there are 'Save', 'Save & New', and 'Cancel' buttons. The main content area is titled 'Edit Comply System Properties Information' and contains a list of configuration fields. Two fields are highlighted with red boxes: 'Instance URL' with the value 'https://ap2.salesforce.com' and 'Merge Webservice Endpoint' with the value 'https://mergevs.apptus.net/c/'. Other fields include 'Name' (System Properties), 'Admin User', 'Agreement Number Field For Imported Docs', 'Allow PDF Selection Override', 'Allow Reconcile Selection Override', 'Api User Key (DEPRECATED)', 'Auto Enable PDF For Final Docs', 'Auto Enable Reconciliation', 'Auto Insert Header Footer Data', 'Bypass Sharing', 'Contract Summary Template', 'Default Opportunity Agreement Owner' (Opportunity Owner), 'Email Template For Checkin Notification', 'Enable Multiple Checkout', 'Enable PDF Security', 'Enable Submit Merge Call', 'Enable Version Control', 'Footer Datetime Format For Imported Docs', 'Max Child Level', 'Merge Call Timeout Mills' (60,000), 'PDF Owner Password', 'Publish Author Events', 'Publish Merge Events', 'Auto Sync With Opportunity', 'Sync Bundle Using Line Items', 'Sync Option Products', 'Enable Clause Approvals', and 'Enable Merge Call Debug'.

2. Define values for the following fields.
 - Merge Webservice Endpoint
 - Instance URL
3. Click **Save**.

- Click **Setup > Administer > Security Controls > Remote Site Settings > New Remote Site**.

- Define values for the following fields.
 - Remote Site Name**
 - Remote Site URL**(your merge server URL)
- Create a **Record Type** (at least on record type. For example, **Rec Type**) on the custom object, where you want to add the Generate document functionality.
- Add that record type to the Agreement Types field (*Apttus__APTS_Template__c.Apttus__Agreement_Types__c*) as a picklist value.
- Add that record type to the Type field (*Apttus__APTS_Template__c.Apttus__Type__c*) as a picklist value.
- Create a Formula field for the **Generate** button on your custom object with the below expression.

```
("/apex/Apttus__DocumentGenerate?id=""&Id=""&action=Generate_Document&templateType=RecTyp",IMAGE("/resource/Apttus__Button_Generate","Generate"),"_self")
```

- Click **Save**.

When I submit the agreement by clicking Submit Request button, why do I get the following error?

```
Error: Missing Target ObjectId with Template
```

You don't have default contact access to the System Administrator Record. There is an Admin Entry created and defined as System Administrator as a Default Email Contact Name.

APTS_DefaultEmailContactName: Symantec Admin

Whenever you submit the Agreement record, the system looks for System Administrator contact. But, the OWD settings is defined as Private for Contact object, so

this contact record doesn't have access to the concerned user. So the concerned user must have the System Administrator contact access to submit the records.

Note

The System Administrator has all record access automatically. So, Admin should not get any issue, but the users don't have access to all records.

Your System Administrator must provide you with access to **System Administrator** record sharing.

When I click the Configure Products button, why do I get the following error?

You will need **Modify All** permission on Product Configurations object.

The Quote Owner or System Admin will be able to configure any products for a quote. If any other user other than quote owner will try to do the same, the system will now the user to configure the Quote and will get the above error.

Ask your System Administrator to provide you with **Modify All** permissions on Product Configurations object.

When I run the Bundle Maintenance, why do I get the following error?

```
Error: First error: Insert failed. First exception on row 0; first error:
NUMBER_OUTSIDE_VALID_RANGE, Depth: value outside of valid range on numeric field: 10:
[Apttus_Config2__Depth__c]
```

You get this error when you've already ran bundle maintenance earlier, and in the middle you abort this process. In our system, we maintain the maintenance jobs status in an object called Batch Job (Apttus_Config2__BatchJob__c). Once the status is stuck in Queued stage, the actual batch job is aborted, and you will face this problem.

Resolution:

When you receive the above error, after running Bundle Maintenance, perform the following steps to resolve records with product components where the option group is null in the **Product Option Component** object.

Run the following Query in the Developer Console. (a Salesforce System Administrator should be utilized or informed when performing this operation).

```
SELECT name, id, Apttus_Config2__ComponentProductId__c,
Apttus_Config2__RelationshipType__c,Apttus_Config2__ParentProductId__c from
Apttus_Config2__ProductOptionComponent__c where
Apttus_Config2__ProductOptionGroupId__c = NULL
```

You will receive a list of returned IDs from the above Query. You must identify and delete the Product Component records without any option group assigned. Now, the Bundle Maintenance will execute properly.

How do I include the values in Subcategory field which are lost while saving a template in XAuthor V6.0?

1. Go to **Setup > Create > Objects**.
2. Search for **Template** object and click to open it.
3. Go to **Custom Fields and Relationships**.
4. Click **Category**.
5. Go to **Field Dependencies** and edit **Subcategory** to see the following screen.

Apttus Contact Support

If you experience an issue with an Apttus product and need help, you can contact Apttus Support. Before you contact Apttus support, prepare a brief description of the problem you are experiencing. Additionally, to enable us to resolve your problem at the earliest, provide the following important information:

- What is the environment in which you are experiencing the problem: Sandbox or Production?
- How many users are affected?

Which product versions are installed?

To determine version numbers:

1. Go to **Setup > App Setup > Installed Packages**.
2. In the Installed Packages section, all the installed packages are displayed. You can find the version numbers in the Version Number column.

Action	Package Name	Publisher	Version Number	Namespace Prefix	Status	Allowed Licenses	Used Licenses	Expiration Date

What is your Salesforce.com Organization ID?

To determine the [Salesforce.com](#) organization ID:

1. Go to **Setup > Administration Setup > Company Profile > Company Information**.

2. From the Organization Detail pane, provide the [Salesforce.com](https://www.salesforce.com) Organization ID.

		Restricted Logins, Current Month	0 (0 max)
		Salesforce.com Organization ID	00Dd0000000eKuN

If you are having issues generating documents, what is your merge server end point?

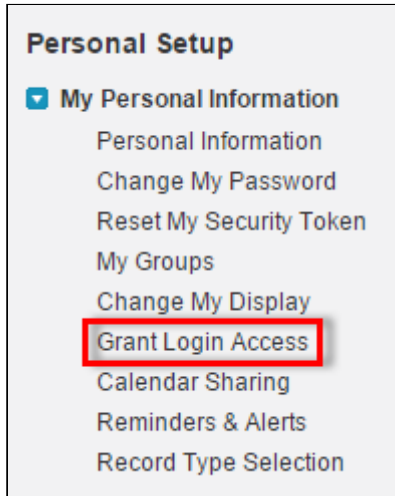

To find the merge server end point:

1. Go to **Setup > App Setup > Develop > Custom Settings**.
2. Click **Manage** for Comply System Properties.
3. Click **System Properties**.
4. The Merge Webservice Endpoint field displays the setting. The `https://mergeserver.apttus.net:9876` portion of the setting is what will be helpful to customer support.

Grant Login Access of the affected user and an administrator.

To grant login access:

1. Go to **Setup > Personal Setup > My Personal Information > Grant Login Access.**

2. From the Apttus Support picklist, select an option for access duration.

Grant Access To	Access Duration
Your Company's Administrator	--No Access--
Salesforce.com Support	--No Access--
Apttus Support i	--No Access-- --No Access-- 1 Day (exp. 10/30/2015) 3 Days (exp. 11/1/2015) 1 Week (exp. 11/5/2015) 1 Month (exp. 11/29/2015)
