In these release notes, you can find packages, requirements, features, enhancements, fixed issues, and known issues for the Conga Revenue Lifecycle Platform 202406.1.0 release. For documentation updates, see [What's New in Conga Revenue Lifecycle Platform](#).

 This documentation may describe optional features for which you have not purchased a license; therefore, your solution or implementation may differ from what is described here. Contact your Customer Success Manager (CSM) or Account Executive (AE) to discuss your specific features and licensing.

New Features and Enhancements

In this release, the Conga Revenue Lifecycle Platform offers the following new features and enhancements.

Workflows: Components

The Components section allows you to view a list of all stages within workflow definitions, and you can edit, delete, unpublish, or publish them. For more details, see [Working with Components](#).

Multi-factor authentication (MFA) using Conga IDP

Implemented multi-factor authentication (MFA) with the Conga IDP to enhance security for your application and users' identities. Now, in addition to entering a username and password, users will need to enter a code sent to their business email address during the login process. For more information, see [Logging in to Conga Revenue Lifecycle Platform](#).

Workflows: Update context/related Objects(s) activity

Now you can set two outcomes Fault and Done for the update activity. The Fault outcome allows you to decide what actions to take if the update fails. Under the Fault outcome, you can add activities such as sending an email or connect it to another activity, like iterating through a loop outcome. For more information see, [Creating Workflows](#).

Control Application Access for Non-Admin Users

You can now use the Role, Permission Groups, and Admin Permissions features to control which applications non-admin users can see on the Conga Revenue Lifecycle Platform. For more information, see [Creating Roles](#) and [Creating Permission Groups](#).

Object Data Explorer: Picklist Selection

You can now select the **None** option for any object with a picklist field in the Object Data Explorer if you don't want to choose a value for that field.

Evaluate Notification Criteria On Trigger

You can now use the Evaluate Criteria On Trigger toggle when creating notifications to check criteria when the notification is triggered. This means the application only considers records that meet the trigger condition at the time the notification is triggered. For more information, see [Creating Notifications](#).

Fixed Issues

There are no fixed issues in this release.

Known Issues

There are no known issues in this release.
